RESULTS OF REGISTRATION IN RHODE ISLAND FROM 1854 TO 1878.

[By C. H. FISHER, M. D.]

The vital statistics of any community for a single year are quite unreliable as furnishing data for definite conclusions. And this is true, more especially, in regard to statistics of mortality. The variations of the death-rate of one year with another, owing to epidemic influences and meteorological conditions, are well known to all sanitarians. But the aggregates and averages of the several kinds of events enumerated under the term of vital statistics, collected with a fair approximation to completeness and accuracy for a long series of years, afford quite reliable data for a great variety of precise comparisons, and the ascertainment of definite relative percentages. In the following tables, summaries, and remarks there will be presented, not only the general and comparative results of a single year, but also of variable periods of years of considerable length.

The latest single year of which full reports have been received from the several towns in Rhode Island was that of 1878, in which the returns showed comparative results, in part, as follows:

To population by census of 1875, one birth to every 38.5 persons, or 26.0 in each 1,000; one person married to every 55.7 persons, or 18.0 in each 1,000; one death to every 58.1 persons, or 17.2 in each 1,000.

For every 100 births, there were about 35 marriages and 66 deaths.

Proportion of the sexes.—In each 100 children born, 50.7 were males and 49.3 were females, or 102.7 males to each 100 females.

The comparative general results of registration for a period of 25 years, 1854 to 1878 inclusive, are as follows:

In every 100 births, there were 3.83 children still-born; in every 100 births, there were 96.17 children living; for every 100 births, there were 81.5 persons married; for every 100 births, there were 65.6 persons deceased.

It has been a question whether the difference in the habits and modes of living in city and country had any influence upon the proportion of the sexes of children born.

The following shows the proportion of the sexes of the children born in Providence, and in the rest of the State, and in the whole State, during the years 1877 and 1878, and also in the twenty-five years from 1854 to 1878, inclusive:

1877.

	Males to each 100 Females.	Males.	Females.
Providence City	104.9, or	51.20 and	48.80 in each 100.
Rest of the State	101.6, or	50.41 and	49.59 in each 100.
Whole State	103.0, or	50.73 and	49.27 in each 100.

1878.

	Males to each 100 Females.	Males.	Females.
Providence City	106.8, or	51.64 and	48.36 in each 100.
Rest of the State	100.2, or	50.06 and	49.94 in each 100.
Whole State	102.7, or	50.70 and	49.30 in each 100.

Twenty-five years, 1854 to 1878, inclusive.

	Males to each 100 Females.	Males.	Females.
Providence City	105.6, or	51.36 and	48.64 in each 100.
Rest of the State	107.2, or	51.74 and	48.26 in each 100.
Whole State	106.5, or	51.60 and	48.40 in each 100.

The foregoing comparisons show that although the proportional number of male births in the city of Providence for the years 1877 and 1878 were considerably in excess of the same in the rest of the State for the same years, it does not hold good for the long period of twenty-five years.

Relation of season to sex.—The following table will present a summary of the quarterly periods, and the proportion of the sexes of the children born during the year 1878:

	Males to each 100 Females.	Males.	Females.
1. January—March	106.6, or	51.59 and	48.59 in each 100.
2. April—June	98.9, or	49.65 and	50.35 in each 100.
3. July—September	103.8, or	50.85 and	49.17 in each 100.
4. October—December	102.0, or	50.50 and	49.50 in each 100.
Year 1878	102.7, or	50.06 and	49.94 in each 100.

Summary of 18 years, 1861 to 1878.

	Males to each 100 Females.	Males.	Females.
1. January—March	105.7, or	51.30 and	48.61 in each 100 born.
2. April—June	106.8, or	51.65 and	48.35 in each 100 born.
3. July—September	105.0, or	51.22 and	48.78 in each 100 born.
4. October—December	106.5, or	51.58 and	48.42 in each 100 born.
For the whole No. of years	106.0, or	51.46 and	48.54 in each 100 born.

Relation of season to whole number of births.—The following synopsis will show the percentage of the aggregate of births in each quarter, without regard to sex, for twenty-five years:

Quarters.	Per cent.
January—March	23.72
April—June	23.89
July—September	26.15
October—December	26.24

It will be noticed that the numbers gradually increase from the first to the last quarter.

Parentage of children born.—The following table will show the variations of the percentages of parentage in each of the last six years, and also those occurring in three periods of five years each, from 1858 to 1872 inclusive:

Parentage.	1878.	1877.	1876.	1875.	1874.	1873.	5 years, 1868 to 1872.	5 years. 1863 to 1867.	5 years. 1858 to 1862.
American	43.00	42.74	40.84	41.90	41.80	45.68	44.17	45.18	48.50
Foreign	42.82	42.38	45.40	44.65	45.59	43.52	44.72	46.37	44.33
American father and foreign mother	6.35	6.67	5.59	5.98	5.34	4.62	4.89	4.07	3.73
Foreign father and American mother	7.83	8.21	8.17	7.47	7.27	6.18	6.22	4.38	3.45
Total	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

By the census of 1875 the population, according to parentage, was as follows: American, 52.17 per cent.; foreign, 47.83 per cent.

In order to contrast the percentages of the children born in the different classes, as seen in the preceding table, with the percentages according to the population, for the same number of years, the following table is introduced:

Children with—	1878.	1877.	1876.	1875.	1874.	1873	5 years. 1868 to 1872.	5 years. 1863 to 1867.	5 years. 1858 to 1862.
American fathers	49.89	49.41	46.43	47.88	47.14	50.30	49.06	49.25	52.22
Foreign fathers	50.11	50.59	53.57	52.12	52.86	49.70	50.94	50.75	47.78
American mothers	50.68	50.95	49.01	49.37	49.07	51.86	50.39	49.56	51.95
Foreign mothers	49.32	49.05	50.99	50.63	50.93	48.14	49.61	50.44	48.05

It will be seen that the percentage of children born of American parentage has been almost uniformly less than the proportion of the American to the whole population, and the percentage of children born of foreign parentage has been equally uniform in being larger than the proportion of that class to the whole population.

NUMBER OF THE CHILD OF THE MOTHER.

The proportion of the first, second, third, &c., child of the mother, in the aggregate of twenty-two years, is as follows:

First child, about one in every four births, or 25.0 per cent. Second child, about one in every five births, or 20.0 per cent. Third child, about one in every six births, or 16.6 per cent. Fourth child, about one in every eight births, or 12.5 per cent. Fifth child, about one in every eleven births, or 9.1 per cent. Tenth child, about one in every seventy-seven births, or 1.3 per cent. Fifteenth child, about one in every 1,580 births. Twentieth child, about one in every 36,384 births. Twenty-first child, about one in every 36,385 births. Twenty-second child, about one in every 55,326 births.

PLURALITY BIRTHS.

Of the whole number of *cases* of child-birth in twenty-six years, one in 93.9 produced twins, and one in 6,781 produced triplets.

Of the whole number of *children* born during the same period, according to the statistics, one in every 47 was a twin, and one in every 2,283 was a triplet.

PARENTAGE AND SEX OF PLURALITY BIRTHS.

Of the whole number of cases of plurality births in twenty-six years, there was 42.5 per cent. in which both parents were Americans; 49.0 per cent. in which both parents were foreign; and 8.5 per cent. in which the parentage was mixed or unknown.

Of the whole number of *children born* in plurality cases during the twenty-six years, 50.08 per cent. were males, and 49.92 per cent. were females.

STILL-BORN—SEX.

Of the still-births reported in Rhode Island for a period of twenty-six years, the proportions of the sexes in the aggregates is as follows: For every one hundred still-births, there were 60 males and 40 females; or for every 100 females, there were 150 males.

And it is worthy of note that this proportion has prevailed with great uniformity during each of nearly all of the single years.

PARENTAGE OF STILL-BORN.

For a period of twenty years the proportions are 43.96 of American, and 56.04 of foreign parentage in each 100 still-births; or 127.4 births of still-born children of foreign parentage to each 100 of American.

SEASON OF STILL-BORN.

For a period of twenty-six years the proportions are as follows: 1st quarter, 25.5 per cent.; 2d quarter, 22.9 per cent.; 3d quarter, 26.0 per cent.; 4th quarter, 25.6 per cent.

MARRIAGES.

Season.

The percentages of the marriages in Rhode Island, in each quarter of the year 1878, may be found in the following table, together with the percentage in each quarter for the twenty-five years previous, viz, from 1853 to 1877 inclusive:

Years.	First quarter.	Second quarter.	Third quarter.	Fourth quarter.	Whole year.
1878, percentage	22.25	24.52	24.01	29.22	100.00
1853–1877, percentage (25 yrs.)	22.31	24.00	23.60	29.49	100.00

It will be observed that the largest percentage of marriages occurred not only in the last quarter of the year 1878, but also in the percentage of the aggregate of the last quarters for the previous twenty-five years. This rule, which has prevailed so uniformly for so lengthened a term of years, has been variously accounted for. Doubtless the approach of the colder season, and the almost universal disposition to closer companionship during its continuance, aided by the increased social proclivities and warmer manifestations of sentiment and affection during the holiday season, contribute largely to the result.

It will also be observed that the smallest number of marriages in any one of the quarterly divisions of the year has been uniformly in the first quarter during the whole period of registration. Considering the ecclesiastical sentiments of a large proportion of the population in regard to the performance of the ceremony of marriage during the Lenten season, and the largely increased ratio of the previous quarter (one extreme following another), it is not at all remarkable that the percentage is so much smaller for the first quarter.

Nativity of persons married.

The number of marriages among parties of purely foreign birth has almost constantly decreased from year to year for the last decade.

The reason is obvious. The proportional number of adults of strictly foreign birth, among the so-called foreign population, is rapidly decreasing; diminished by lessened immigration and by death. The number of those of foreign birth in the periods of life in which the marriage relation is most frequently assumed is fast diminishing from advancing age. The number of marriages of persons of purely foreign birth must, therefore, under the existing order of events, continue to decrease, while the number of those born of parents of foreign birth, but are of themselves of American birth, and rapidly attaining the marriageable age, are steadily increasing, and must continue to help swell the number of marriages of native citizens.

There has been a gradual increase in the number of mixed marriages, though in a somewhat irregular manner, during the whole period of the registration of the same. It is an evidence that the caste prejudice of nationality is gradually diminishing.

In the following table are given the percentages of American, foreign, and mixed marriages in the last five years, and in the aggregate for the twenty years, 1858 to 1877 inclusive. By *mixed* marriages are meant those where one party was of American and the other of foreign birth:

Birth place.	1878.	1877.	1876.	1875.	1874.	20 yrs. Total.
United States	62.60	61.66	62.23	59.04	58.84	61.33
Foreign countries	21.22	21.73	22.77	24.70	27.35	26.19
Mixed	16.18	16.61	15.00	16.26	13.81	12.48
Total	100.00	100.00	100.00	100.00	100.00	100.00

It will be observed that the percentage of marriages of persons of American birth, in 1878, is not only larger than in the two previous years, but it may also be stated that the percentage, in comparison with all others, is larger than for any year since 1868.

It will be seen, also, that the marriages of persons of foreign birth have gradually decreased in percentage, while the marriages of those of mixed nativity have as gradually increased in percentage.

In comparison with the average of twenty years, the percentage of marriages, in 1878, of persons of strictly American birth is somewhat larger; the percentage of those of mixed nationality is larger by about 30 per cent., while the percentage of marriages of persons of strictly foreign nativity has decreased nearly 20 per cent.

DIVORCES.

The average number of divorces granted, in comparison with the average number of marriages, in each of the ten years 1869 to 1878, inclusive, is as follows: For every thirteen marriages there has been one divorce, or 7.7 divorces to each 100 marriages.

DEATHS.

The rate of mortality for the year 1878 was one to every 58.10 of the population, according to the census of 1875, or at the rate of 17.20 in each thousand.

The percentage and death rate are almost precisely what they were in 1877, but differ more with the smaller number of 1876, when the death rate was one decedent to every 62.7 of the population, or 15.9 in each one thousand.

It may be of interest to contrast the percentage of deaths in the city of Providence with those that occurred in the rest of the State, according to population, for the purpose of showing the difference in the rate of mortality between city life, under favorable circumstances, and life in villages and rural districts.

In order to bring before the eye in a more direct manner the comparisons alluded to, the following synopsis for the years 1876, 1877, and 1878 is presented:

1876.

	One death in every—	In each 1,000.
Providence City	54.00	18.50
Rest of State	70.00	14.28
Whole State	62.70	15.90

1877.

Providence City	51.90	19.25
Rest of State	62.70	15.94
Whole State	58.30	17.20

1878.

Providence City	50.62	19.89
Rest of State	64.26	15.56
Whole State	58.10	17.20

The observation has been frequently made that the difference in mortality between the city and State, shown by the statistics of deaths as reported from the towns, could not be relied upon as entirely correct. It is believed that many of the villages of the State have quite as insalubrious surroundings as any parts of the city of Providence; and, although it is known that in the rural districts, at least, the percentage of children, in whom the mortality is largest, is much smaller than in the city, still, the rate of mortality could scarcely show so much disparity if the whole number of deaths outside of the city were fully reported.

The failure to return the whole number of deaths occurs mainly in those towns having a large manufacturing population, among which frequent removals are almost the rule, rather than exception, and where burial permits are not required. It is very certain that there will never be anything like complete returns of deaths until burial permits are required in every town in the State.

SEX OF DECEDENTS.

Of those persons whose deaths were returned during the year 1878, the ratio stands at 94.78 males to each 100 females, or 48.66 males and 51.34 females in each 100 decedents.

For a period of twenty-six years the proportion of the sexes in the aggregate of the whole number of decedents reported during that time, is as follows:

Males, 49.18 per cent.; females, 50.82 per cent.; or, 96.8 males to each 100 females.

Not only in the aggregate of the twenty-six years, but also in nearly all of the separate years during the whole period of registration, there has been an excess of females among the decedents; and it may be added that an excess of males among the children born has been equally uniform during the same period.

A natural inference would be that the male portion of the population must be largely in excess of the female portion and annually increasing.

But by reference to the census report of 1875 it is found that the females exceeded the males in the population, the proportions being as follows: Males, 48.62 per cent.; females, 51.38 per cent.; or 105.7 females to each 100 males.

There has evidently been a larger proportional emigration of native males from the State or a much larger proportional number of female immigrants.

SEASON AND MORTALITY.

The influence of season upon mortality may be illustrated by the following table, which shows the percentage of deaths in each quarter of each of the last five years, and in the aggregate for the twenty-one years from 1853 to 1873, inclusive.

Season.	1878.	1877.	1876.	1875.	1874.	1853–1873.
	Per ct.	*Per ct.*	*Per ct.*	*Per ct.*	*Per ct.*	*Per ct.*
January—March	25.87	21.03	23.03	25.50	23.10	23.12
April—June	21.81	21.53	22.89	21.13	24.71	21.23
July—September	26.46	29.60	30.34	28.82	28.02	30.98
October—December	25.86	27.84	23.74	24.55	24.17	24.67
	100.00	100.00	100.00	100.00	100.00	100.00

In regard to the influences of city life in connection with season, in the production of mortality, a contrast of the rate in the city of Providence may be made with that of the whole State. But it may be observed that a contrast with regard to the habits and modes of life, between the city and rest of the State, would not show such marked differences as might be expected. The great proportional number and proximity of the villages of Rhode Island, with their facilities of access, and the frequent communication of residents therein with each other and with the city of Providence, make the entire population more homogeneous in character than that of any other State. Then, the city of Newport and several villages large enough for incorporation into cities, and a considerable number but little less in size, present all the essential conditions of city life in their sanitary relations, as well as in the customs and modes of living of the inhabitants. Under these circumstances, it would not be expected that there would be any great difference in the percentage of mortality, in the same quarters of the year, between the city of Providence and the State at large.

An examination of the table below will show that the mortality rates of the city and State, in regard to season, do not largely differ, for in a period of twenty-four or more years the average percentage in the same quarters between the city and the whole State does not in any instance reach as high as three-quarters of one per cent.

Of course the exact difference is not shown, because the death statistics of the city are merged in those of the State, but the result is sufficiently conclusive in establishing the fact that, whatever difference there may be, it does not exceed one per cent. in the average of any lengthened period of time.

Season.	1855–1878. Providence.	1855–1878. Whole State.
	Per cent.	*Per cent.*
January—March	23.89	23.28
April—June	21.93	21.53
July—September	29.76	30.37
October—December	24.42	24.82
Total	100.00	100.00

PARENTAGE OF DECEDENTS.

The following table gives the percentage of decedents of American and of foreign parentage in each of last five years, and in the aggregate of twenty years previous to 1878:

Parentage.	1878.	1877.	1876.	1875.	1874.	1858–1877.
	Per ct.	*Per ct.*	*Per ct.*	*Per ct.*	*Per ct.*	*Per ct.*
American	51.36	51.21	52.24	57.12	54.10	57.60
Foreign	48.64	48.79	47.76	42.88	45.90	42.40
Total	100.00	100.00	100.00	100.00	100.00	100.00

It will not fail to be noticed upon examination of the above table that the difference in number and percentage between the decedents of American and foreign parentage has been steadily lessening. Previous to 1877 the percentage of decedents of foreign parentage had not *averaged* annually for the period of nineteen years as high as 43.00 per cent. It will now be seen that the foreign percentage has *averaged* more than 46.00 per cent. annually for the last five years, and has nearly reached 49.00 per cent. during the years 1877 and 1878.

AGE OF DECEDENTS.

The average age of all the male decedents reported in 1878 was 29.02 years; and the average age of all the female decedents during the same year was 31.11 years.

For the year 1877, the average age of males was 29.25 years, and of females 31.56 years.

The following table will show the average age of the whole number of decedents in each of the last five years, and in the aggregate of twenty years from 1858 to 1877, inclusive:

	1878.	1877.	1876.	1875.	1874.	1858–1877. 20 years.
Average age	30.09	30.45	32.37	31.27	29.86	30.53

PARENTAGES OF DECEDENTS AT DIFFERENT AGES.

The following table shows the percentages of decedents in different divisions of age in each of the last six years, and in the aggregate of twenty years from 1853 to 1872, inclusive:

Periods of life.	1878.	1877.	1876.	1875.	1874.	1873.	1853 to 1872.
Under 1 year	16.6	17.4	19.5	20.8	19.9	19.3	17.8
1 and under 2	8.1	8.1	7.4	6.8	7.8	9.2	8.8
2 and under 5	10.3	9.5	7.0	7.0	9.4	8.1	8.7
Total under 5	35.0	35.0	33.9	34.6	37.1	36.6	35.3
5 and under 10	6.2	6.2	4.2	4.0	5.7	5.3	4.8
10 and under 20	6.1	5.4	5.2	5.5	6.0	6.9	6.0
20 and under 30	8.8	8.9	9.1	9.6	8.7	9.1	9.6
30 and under 40	7.6	7.5	7.7	7.9	6.9	7.8	8.4
40 and under 50	6.4	6.6	6.9	7.7	6.8	6.5	7.3
50 and under 60	7.6	7.2	7.5	7.4	7.0	6.4	7.1
60 and under 70	7.9	8.8	9.3	8.6	7.8	7.6	7.6
70 and under 80	8.8	9.5	9.8	8.4	8.1	8.3	7.8
80 and under 90	4.8	4.0	5.2	5.0	4.7	4.5	5.0
90 and over	0.8	0.9	1.2	1.3	1.2	1.0	1.1
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0

The results of a single year, or of two or three years, have little value in arriving at definite conclusions. The occurrence of one or more epidemics in one year, affecting children chiefly, and the occurrence in another year of epidemics affecting adults chiefly, or all ages alike, would make great differences in the ratio of mortality in the different periods of life, in short terms of years. But in periods of twenty years or more the results may be considered as reasonably conclusive.

It will be seen by the preceding table that the average percentage of mortality of children of five years of age and under, in Rhode Island, for a period of twenty-six years, has not exceeded 35.3 per cent. This is a low rate as compared with the statistics of some other States, in which the rate is stated to be as high as from 40 to 42 per cent.

COLORED DECEDENTS.

Considerable public interest has been manifested in the question whether the colored race was self-sustaining, in regard to population, in the colder latitudes of America. A comparison of the births and deaths among this class of people, for a long series of years, in the different States, will be of value in obtaining correct conclusions.

In the State of Rhode Island the statistics in regard to births, marriages, and deaths among the colored people have, for obvious reasons, been reported separately for a considerable number of years.

Age.—The average age of the colored decedents in Rhode Island, in 1878, was as follows:

	Providence City.	Rest of State.	Whole State.
Colored males	16.83 years	38.21 years	21.66 years.
Colored females	31.07 years	33.46 years	31.97 years.

The difference between the white and colored population in the vital statistics of the year 1878 was as follows:

Whites.....one child born in 38.5; one person married in 56.1; one death in 58.8
Colored.....one child born in 36.4; one person married in 39.2; one death in 40.2

In regard to births, marriages, and deaths the numbers are larger in proportion to the population among the colored than among the whites.

The following summary shows the number of births, marriages, and deaths among the colored population of Rhode Island in the last eighteen years, from 1861 to 1878, inclusive:

Total 2,447 births; 1,125 marriages; 2,405 deaths. For every 100 births there were 91 persons married and 98.3 deaths.

The circumstances favorable to the promotion of the physical health and vigor of the colored race are believed to be at least quite as ample in Rhode Island as in any other Northern or Eastern State. When we find that in a period of eighteen years, as seen in the synopsis above, the excess of births over the deaths is only 42, or less than 2 in each 100, and have full knowledge of the fact that the State is having accession annually to the number of colored people by immigration, and that accession largely in the periods of life between 20 and 40 years, and of both sexes, we must conclude that the race is not self-sustaining in this latitude.

CAUSES OF DEATH.

Of the deaths reported cause *unknown*, in 1878, there was in Providence City one in every 124.3. In the rest of the State, one in every 12.6. Whole State, including Providence, one in every 21.1.

In a period of 16 years, 1863 to 1878, inclusive, the annual average of the aggregates of cause reported unknown was as follows:

Providence City, one in every 91.1, or 1.09 per cent. Whole State, one in every 17.6, or 5.6 per cent.

The above statistics present very conclusive evidence of the necessity of requiring, by statute law, an immediate and full report of death and cause of same, and the authorized issuance of a burial permit previous to any final disposal of the dead.

Such report and permit are required by municipal ordinance in the city of Providence, but not elsewhere in the State.

COMPARATIVE RESULTS—1878.

The following table will show the percentage of several principal causes of death to the whole number of specified causes of deaths in the whole State, and in the City of Providence.

Causes of death.	Whole State, 1878.	Providence City.
Apoplexy and paralysis	4.45	3.35
Brain, diseases of	3.28	3.45
Cancer	2.82	2.43
Cholera infantum	3.97	3.60
Consumption	15.98	15.46
Convulsions and fits	2.63	2.94
Croup	2.20	1.98
Debility	1.91	1.83
Diarrhœa	1.25	1.42
Diphtheria	10.28	12.42
Dysentery	.95	0.56
Fevers	3.94	2.84
Heart, diseases of	3.92	4.21
Whooping-cough	1.28	2.18
Hydrocephalus	1.65	1.98
Kidneys, diseases of	1.89	2.38
Liver, diseases of	1.06	0.86
Marasmus	1.30	1.98
Pneumonia and congestion of lungs	7.49	7.10
Scarlatina	2.03	2.89

COMPARATIVE RESULTS—1855–1878.

The following table will show the percentages of deaths from several prominent causes of death in the aggregates of mortality for periods of years varying from 14 to 24; and also the percentages of the parentage, sex, and age of the decedents:

Diseases.	Percentage of total mortality.	Sex.		Parentage.		Divisions of age.						Number of years.
		Males.	Females.	American.	Foreign.	Under 5.	5 to 10.	10 to 20.	20 to 40.	40 to 60.	60 and over.	
Apoplexy and paralysis	3.60	48.5	51.5	77.8	22.2	0.5	0.7	0.4	6.2	24.1	68.1	14
Brain, diseases of	3.80	53.8	46.2	52.1	47.9	24.0	....	....	....	....	....	14
Cancer	2.54	25.1	74.9	66.1	33.9	....	....	....	....	70.1	29.2	14
Cholera infantum	5.74	51.9	48.1	45.7	54.3	100	....	....	....	....	....	14
Consumption, pulmonary	16.96	45.1	54.9	48.7	51.3	....	....	11.8	49.2	23.3	..	19
Croup	1.90	50.8	49.2	42.1	57.9	67.2	20.1	4.3	....	....	..	14

Pneumonia	6.31	49.0	51.0	57.7	42.3	35.0	2.6	3.3	12.1	17.3	29.7	14
				(14 yrs.)								
Scarlatina	4.20	47.9	52.1	47.4	52.6	....	....	....	....	....	....	24

CONSUMPTION.

The following table will show the results of the registration of that cause of death by counties for nineteen years, inclusive:

1860–1878.

	Yearly average to population, one in every	Yearly average. No. of deaths.	
Bristol County	442	21.4	or 2.26 in each 1,000
Kent County	403	43.8	or 2.48 in each 1,000
Newport County	492	42.7	or 2.03 in each 1,000
Providence County, towns	403	182.3	or 2.48 in each 1,000
Providence City	349	229.0	or 2.87 in each 1,000
Washington County	452	42.0	or 2.21 in each 1,000

CROUP AND DIPHTHERIA.

These diseases, similar in some respects, are considered together, for the purpose of presenting their various relations, and not from any suspicion that they may be identical.

Sex.—For the period of twenty-one years, the percentage of mortality from croup in the sexes was, in each 100, 50.90 males, and 49.10 females.

In diphtheria the percentage of mortality for the same period (the whole period of the registration of diphtheria) was 47.48 males, and 52.52 females, in each 100 decedents.

Sex and parentage in each 100 decedents.

1865–1878.

Disease.	Males.	Females.	Total	American parentage.	Foreign parentage.	Total.
Croup	50.82	49.18	100.00	42.02	57.98	100.00
Diphtheria	49.15	50.85	100.00	51.66	48.34	100.00

In regard to the parentage of the decedents, it will be seen that although the foreign population in the State is considerably less than the American, the decedents from croup are in large excess of foreign parentage, and the decedents from diphtheria are in excess of American parentage.

When we consider the numerical relations of the two classes of population, it will, however, be found that there is a slight excess of *percentage* of mortality from diphtheria of foreign parentage.

SEASON AND MORTALITY.

In the following table croup, diphtheria, and scarlatina, having some characteristics in common, are presented in contrast.

The table will give the average monthly and quarterly per centages of deaths from each disease during the periods named.

Months.	Croup. 1855–1878.	Diphtheria. 1858–1878.	Scarlatina. 1855–1878.
	Per cent.	*Per cent.*	*Per cent.*
January	12.21	9.05	11.65
February	10.66	6.45	11.13
March	8.31	7.34	10.31
First quarter	31.18	22.84	33.09
April	7.05	7.56	8.48
May	5.11	6.31	9.21
June	4.75	6.04	9.01
Second quarter	16.91	19.91	26.70
July	3.26	4.77	6.02
August	3.04	5.81	4.64
September	6.42	8.79	4.53
Third quarter	12.72	19.37	15.19
October	10.66	12.79	6.13
November	13.29	14.11	7.91
December	13.24	11.98	10.98
Fourth quarter	39.19	37.88	25.02
Totals	100.00	100.00	100.00

It will be observed that the above statistics of croup and scarlet fever are for the whole period of twenty-six years, from 1853 to 1878, inclusive, while those of diphtheria are only for the period of twenty-one years, from 1858 to 1878, inclusive, the year 1858 being the first in which deaths from diphtheria were reported.

It will be interesting to study the above table, in relation to the season of greatest mortality, in each of the diseases placed in comparison.

For instance, in the case of croup, we see that the average percentage of a period of twenty-six years, regularly diminishes from the

beginning of the year, until August, in which month we find the minimum percentage, and then as regularly increases through the remainder of the year, the highest percentage being found in December.

In scarlatina, the percentages diminish in an almost equally uniform manner until September, in which the lowest percentage is found, and the only break in the regularity of diminution during the nine months occurring in April. The percentages, then, with entire regularity, increase each month until January, in which is found the maximum.

In diphtheria, for the period of twenty-one years, the percentages diminish, though somewhat irregularly, from and including December, through the first half of the year, and reaching the minimum in July; then increasing quite regularly until November, in which month is found the highest percentage.

It will be noticed that diphtheria anticipates both croup and scarlatina in the time of reaching the lowest percentage, by one month in the case of croup, and by two months in the case of scarlatina.

But aside from the similarity of the three diseases, in the diminution of mortality and prevalence also, as the months of the warmer season advance, there are decided differences in the relative percentages of the several quarterly divisions of the year.

The following summary will present very concisely the differences in the percentages of mortality, from the different diseases, in each of the quarterly periods, as above computed, and by other modes of comparison. It will be kept in mind that the percentages of diphtheria are for a period of five years less than either of the others, but it is hardly probable that a more extended period would materially change the results as to its own percentage of mortality in the different seasons:

Percentages.	First quarter.	Second quarter.	Third quarter.	Fourth quarter.	First four months.	Second four months.	Third four months.	First six months.	Second six months.
Croup	31.18	16.91	12.72	39.19	38.22	16.16	45.62	48.08	51.92
Diphtheria	22.84	19.91	19.37	37.88	30.40	22.94	46.66	42.75	57.25
Scarlatina	33.09	26.70	15.19	25.02	41.28	29.17	29.55	59.79	40.21

These contrasts show very decidedly the variations of the three diseases, in the ratio of mortality, in the different seasons of the year. It will be noticed that in croup and diphtheria the largest mortality is in the last third and last half of the year, and in scarlatina the reverse is the rule, the greater number of deaths occurring in the first third and first half of the year, or more than .41 per cent. in the first third, and nearly .60 per cent. in the first half of the year.

The above results are for considerably lengthened periods of time, and the various relations they present, and the comparisons which have been made, and which can be much farther extended, may be of some value in elucidating the dark aspects, and in helping to the solution of the vexing problems that face the sanitarian at every step in the investigation of the phenomena of life and death.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Fort Randall, Dak.—Under date of June 18, Dr. J. D. Hall, U. S. Army, reports two cases of measles in the family of a married soldier at that post. The family arrived there three weeks ago, and the disease was contracted at a hotel on the way.

Harrison County, Miss.—Dr. F. S. Hewes, secretary of the county board of health, sends the following resolutions adopted by that board:

Extracts from proceedings board of health for Harrison County, Miss., at a regular meeting held June 21, 1880.

Resolved by the board of health for Harrison County, Miss., That the rules and regulations of the National Board of Health for river inspection service, Code A, so far as they can be applied to steamers navigating the Mississippi Sound, and the rules and regulations of said national board for inspection of railroads, to prevent the introduction of infectious diseases into the United States from foreign countries, and from one State into another, be, and are hereby, adopted as the rules and regulations of this board, and that the sanitary inspectors appointed by this board shall be governed thereby in the performance of their duties.

Resolved, That the resignation of Dr. G. N. Smith as sanitary inspector for the west half of this county be, and is hereby, accepted.

Resolved, That Dr. Charles L. LeRoux be, and is hereby, appointed sanitary inspector for the west half of this county, to be stationed at Pass Christian, vice Dr. G. N. Smith, resigned.

MISCELLANEOUS.

New Bedford, Mass., June 11.—The health officer forwards the following report from quarantine station: Ship Milton, 83 days from Talcahuano, with clean bill of health dated March 25, signed by W. Crosby, U. S. consul; has not touched at any intermediate port, nor communicated with any vessel on the voyage. April 1 small-pox appeared on board, and up to May 8 there were 9 cases and 4 deaths, occurring April 6, 22, 25, and May 2. No other contagious disease on board. Number of crew at sailing, 21, and 2 "stow-aways"; no passengers. Cargo, oil. The ship will be detained at quarantine as may be required.

Notice.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

The following reports, for the week ending June 19, are from places requiring burial permits and having less than 5,000 population:

Bridgewater, Mass., 4,000: one death. East Haven, Conn., 1,200: no deaths. Edgartown, Mass., 1,400: no deaths. Morgan City, La., 2,500: no deaths. Murfreesborough, Tenn., 3,500: diarrhœa 1. Saint Augustine, Fla., 2,500: accident 1. San Diego, Cal., 3,000: no deaths. Shelbyville, Tenn., 2,000: old age, 1. Total population, 20,100: total deaths, 4: annual rate per 1,000, 10.3.

The following reports, for the week ending June 19, are from places in which burial permits are not required:

Alexandria, Va., 13,000: deaths, 2: under 5 years, 1; malarial fever 1, pneumonia 1. Allegheny, Pa., 75,000: deaths, 25: under 5 years, 16: consumption 1, diarrhœa 7, enteric fever 2, scarlet fever 1, pneumonia 1, whooping-cough 1. Bath, Me., 10,000: no deaths. Battle Creek, Mich., 7,500: no deaths. Belfast, Me., 5,278: deaths, 2; pneumonia 1. Boulder, Colo., 3,500: no deaths. Brattleborough, Vt., 6,500: deaths, 4: consumption 2, measles 1. Cambridge, N. Y., 1,850: no deaths. Chico, Cal., 2,500: no deaths. Circleville, Ohio, 6,400: deaths, 5: under 5 years, 3: consumption 1, diarrhœa 1. Clinton, Mich., 1,200: no deaths. Columbus, Ga., 9,000: deaths, 3; under 5 years, 2. Corinth, Miss., 2,300: no deaths. Crystal Springs, Miss., 1,000: no deaths. Cumberland, Md., 12,000: deaths, 3, under 5 years; diarrhœa 2. Dallas, Tex., 20,000: deaths, 2, under 5 years; croup 1, malarial fever 1. Davenport, Iowa, 27,000: deaths, 5; consumption 1. Decatur, Miss., 1,000: no deaths. East Saginaw, Mich., 18,000: deaths, 6: under 5 years, 4: consumption 1, diphtheria 2, diarrhœa 1. Fayette, Miss., 300: no deaths. Flint, Mich., 10,000: deaths, 2, from consumption. Gunn City, Mo., 125: no deaths. Helena, Mont., 3,500: one death. Indianola, Tex., 900: no deaths. Iuka, Miss., 1,000: no deaths. Jefferson, Tex., 3,250: deaths, 3; under 5 years, 2: malarial fever 1. Kenosha, Wis., 5,000: deaths, 2; under 5 years, 1. La Fayette Springs, Miss., 300: no deaths. Lansingburgh, N. Y., 7,150: old age 1. Lebanon, Pa., 9,000: no deaths. Little Falls, N. Y., 5,900: accident 1, under 5 years. Louisiana, Mo., 5,200: deaths, 2: under 5 years, 1: consumption 1, diarrhœa 1. Madison, Ind., 12,000: deaths, 9: under 5 years, 4; consumption 2, diphtheria 1, diarrhœa 1. Milledgeville, Ga., 4,000: one death, under 5 years. Mount Pleasant, Iowa, 5,000: deaths, 2: consumption 1. Muscatine, Iowa, 7,500: two deaths. Muskegon, Mich., 13,000: pneumonia 1, under 5 years. Natchez, Miss., 10,000: deaths 3: under 5 years, 1: malarial fever 1. Nebraska City, Nebr., 5,000: whooping-cough 1, under 5 years. Ocala, Fla., 1,000: no deaths. Oshkosh, Wis., 18,000: deaths, 2: under 5 years, 1; pneumonia 1. Painesville, Ohio, 5,000: deaths, 3: under 5 years, 1; consumption 1, old age 1. Pearlington, Miss., 1,500: no deaths. Phœnixville, Pa., 6,000: consumption 1. Pleasant Hill, Miss., 250; no deaths. Pontotoc, Miss., 600: no deaths. Port Gibson, Miss., 1,400: no deaths. Port Jervis, N. Y., 10,000: no deaths. Portsmouth, Va., 14,000: deaths, 6: diarrhœa 2, scarlet fever 1. Pulaski, Tenn., 2,100: one death. Ripley, Miss., 1,200: no deaths. Rock Island, Ill., deaths, 5: diarrhœa 2, malarial fever 2: no population given. Rockland, Me., 7,000: one death. Santa Cruz, Cal., 5,000; no deaths. Springfield, Ohio, 23,000: deaths, 10: under 5 years, 4; consumption 3, diarrhœa 3, old age 1. Starkville, Miss., 1,454: no deaths. Steubenville, Ohio, 13,500: deaths, 3: under 5 years, 2. Tampa, Fla., 1,200: no deaths. Titusville, Pa., 9,000: enteric fever 1. Verona, Miss., 1,000: no deaths. Wessor, Miss., 2,000: no deaths. Winona, Minn., 10,000: deaths, 2: consumption 1. Youngstown, Ohio, 17,000: deaths, 6: under 5 years, 3: consumption 2, diarrhœa 1. Total population, 432,357: deaths under 5 years, 55: total deaths, 124: annual rate per 1,000, 13.4.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JUNE 19, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

States and cities.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death rate per 1,000 of	Consumption.	Croup.	Diarrhœal diseases.	Diphtheria.	Enteric.	FEVER. Malarial.	FEVER. Scarlet.	FEVER. Yellow.	Lung diseases acute.	Measles.	Puerperal diseases.	Small-pox.	Whooping-cough.	All zymotic diseases.	Accidents.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JULY 10, 1880. [No. 2.

YELLOW FEVER AT THE NEW YORK QUARANTINE.

Dr. W. M. Smith, health officer, sends the following report, under date of June 25:

REPORT OF SICKNESS ON THE STEAMSHIP COLON.

The steamship Colon, from Aspinwall, June 7, 1880, arrived at lower quarantine on the 15th instant.

The surgeon reported that the day of sailing a passenger named Owen McLean, a native of Ireland, aged 36, was taken sick and died June 12.

The man had been on the isthmus working in a quarry for several months. Was in Aspinwall two days before sailing. The history of this case during its progress is very imperfect. Slight chills, headache, pains in the back, scanty urine, and towards the last entire suppression and partial convulsions, is the sum of the observations in this case communicated by the physician of the steamship.

June 11, Eugene F. Strobel, another passenger, aged about 35, was taken sick, and removed to Swinburne Island Hospital the morning of the 16th. This man had been residing on the isthmus eighteen months, engaged at the Empire Gold Mining Company. When brought into hospital he was insensible. Pulse 60; extremely feeble; restlessness, alternating with brief periods of stupor; the skin jaundiced over the whole surface; the countenance suffused and darkened by capillary congestion, blended more or less with the icterus, gave a brown and almost bronzed appearance to the face; dark-colored blood had effused from the gums and incrustated on the lips and at the angles of the mouth. Some hours before leaving the steamer he had vomited a dark, grumous-looking fluid. This was repeated on the way to the hospital, and continued at short intervals until a short time before death. The ejections noticed had a dark, granulated appearance, evidently changed blood. There was no opportunity to secure urine for analysis. The steamer's physician reported the secretion from the kidney very scanty and albuminous. The patient died at 7 p. m.

Autopsy 15 hours after death.

A section from the anterior lobe of the liver, under the glass, exhibited the following conditions: Slight increase of connective tissue, some fat evenly distributed; deeply pigmented; pigment arranged around the central vessels; intralobular veins dilated, and atrophy of liver-cells around them.

The Colon was detained for observation.

The morning of the 16th visited the Colon again, and found James Watson, a passenger, sick. A careful examination discovered the fact that he had been indisposed since the 14th, but did not complain to the doctor until after the visit of the quarantine officer, the 15th. The evening of the last-mentioned date complained of frontal headache and pain in the loins; pulse 100; surface temperature high, as determined without a thermometer. The doctor gave him a cathartic and 40 grains of quinine in the first 12 hours, subsequent to his attention being called to him. At 9 a. m. of the 16th I visited him at the steamship. Pulse 95; temperature 104; face flushed; sclerotic injected; headache, and pain in the loins. He was immediately removed to Swinburne Island Hospital. Vomited several times on the way. Nothing unusual in the appearance of the ejections.

June 17.—Visited Watson at 9 a. m. Said he was better; no pain; complained of nothing but weakness; sclerotic much injected; pulse 90; temperature 103¾. Visited at 6 p. m. of same day. Pulse 85, feeble and irregular; muscular tremor; complained of being "so weak"; said he had passed no water during the day. Nurse said secretions from kidneys night before had been very scanty; had several movements of the bowels; dejections dark and "tarry."

18th. Patient much prostrated; muscular tremor; could scarcely carry cup to his mouth; complete suppression of urine; intellect clear; no further movement of bowels; occasional vomiting; ejections very dark; pulse 90; temperature 103.

19th. Visited patient at 6 a. m. Was quiet, but excessively prostrated; no discharge of urine; pulse irregular, 95; temperature 102½; vomited during the night several times; ejections the color of dark port wine; intellect clear; has vomited at intervals of 3 or 4 hours; quiet, calm, and restful. Patient died at 11 a. m., exhaustion being the prominent symptom; intellect clear until an hour previous to death.

Antopsy 20 hours after death.

Mucous coat of stomach congested; patches the size of nickel penny to 50-cent piece intensely ecchymosed. A few lines of mucous membrane, comparatively free from congestion, and then another patch of mucous membrane of variable size of dark brown vessels loaded with blood. The kidneys were, to the unassisted eye, intensely congested; bladder empty; liver studded by small patches of vascular net-work; inferior surfaces intensely loaded by what seemed to be hypostatic congestion, a deep brown hue extending 3 or 4 lines into the parenchyma. One section of kidney appeared to the unassisted eye intensely congested. Microscopical examination showed no interstitial changes. Section through the pyramid, from cortex to apex, shows the ascending and descending tubes in a condition of acute parenchymatous nephritis; in other words, acute fatty degeneration; convoluted tubes are in same condition: many tubes show no epithelium at all. Liver very fat; considerable pigment arranged around the central vessels; central vessels dilated.

In conclusion, I would say that the microscopical examination is not complete in the above cases. A more extended and careful examination will be given them.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

DES MOINES, IOWA.—Dr. L. F. Andrews, secretary of the State board of health, forwards blank forms for reporting and recording contagious diseases and their results: also brief circulars giving directions concerning small-pox and diphtheria. The papers indicate an active effort on the part of the board to promote the public health and to collect and preserve the records of diseases.

HAVANA, CUBA.—During the week ending June 22 there were 35 deaths from yellow fever, of which 12 were among the citizens and 23 in the military hospitals. Several Spanish vessels at the wharves are reported to have had cases on board. Eight deaths from small-pox are recorded for the week.

During the week ending June 25 there were 46 deaths from yellow fever, of which 18 were among the citizens and 28 in the military hospitals. Several vessels which have had yellow fever on board have gone into the bay at the risk of infecting vessels at anchor there. Only two deaths from small-pox are reported for the week.

NAVASOTA, TEX.—Under date of July 2, Dr. A. R. Kilpatrick reports the total population, by the last census, as 1,645, which is much less than the previous estimate. In May there were 6 deaths, 4 white and 2 colored, and one still-birth. Three of the four whites died of consumption, but were not residents. In June the deaths were, three white children, one from cholera infantum and two from congestion of the brain; one colored infant, from diarrhœa. The lowest temperature in May was 58°, on the 2d; the highest, 94°, on the 12th; rain on 9 days. In June, the lowest temperature 65°, on the 18th; highest, 94°, on the 1st; rain on 9 days. For the two months 12 births are reported, 6 white and 6 colored.

PASS CHRISTIAN, MISS.—Under date of June 8, Dr. C. L. Le Roux gives the following account of this place:

Pass Christian is situated on the New Orleans and Mississippi Railroad, 15 miles east from Mississippi City, the county seat of Harrison County, and 5 miles west from the town of Shieldsboro' (Bay Saint Louis), the county seat of Hancock County. It has, in winter, a population of about 2,000 inhabitants, 400 of whom are colored. The town is composed of only two streets, running parallel to each other, east and west, and the whole length of which extends for a distance of 5 miles along the Gulf Sound, and so near the beach that the houses, all facing the sea-breeze, enjoy a constant and thorough ventilation. The rear portion of the town is protected by a dense forest of pine-trees from the north winds. It being a favorite summer resort, the summer population is at least double that of winter. It enjoys the reputation of being one of the healthiest spots in the United States. Dr. G. N. Smith is the oldest resident physician, and in a practice of 25 years only saw here, as far as he can remember, 4 cases of membraneous croup, 1 of diphtheria, not a single case of typhoid fever originating here; but very few cases of measles,

or of scarlet fever; these due to contact with cases that had come from New Orleans, the type of which is invariably very mild. There is no malaria, or at least very little. A few cases are seen in the summer and fall presenting a bilious and intermittent character, the duration of which is only of from 2 to 5 days, and readily yielding to the administration of a light mercurial purgative and a few grains of quinine. As for yellow fever, it has always been traced to importation from New Orleans, and the cases are generally very mild. Between the years 1867 and 1868, covering an interval of 11 years, there was not a single case of yellow fever at the Pass, in spite of all communications being left perfectly free and no extra sanitary measures employed. In 1878 there were 222 cases, 18 of which proved fatal. One-half of these 18 fatal cases were paupers, and either received inadequate attention or none at all. The supply of water comes chiefly from bored or dug wells, their depths varying from 12 to 20 feet, in a soil composed almost entirely of coarse white sand. There are a few cisterns above ground, but very few under ground. The privies, almost universally, stand at a good distance from any water supply; the majority are composed of a simple hole dug into the ground, some few having movable receptacles. The drinking water has always been considered of very good quality, the best being derived from natural springs which never go dry, and several of which are to be found on the adjoining beach.

The streets and houses are kept in a fair condition of cleanliness, even those occupied by the blacks

One mile and a quarter from our shore there is a sufficient depth of water to permit large vessels to come in for lumber, most of which are from Havana and Vera Cruz. They are first boarded by Dr. Martin at Ship Island, treated according to the rules of both the National and our county boards of health, and boarded a second time by Dr. Le Roux, health officer of Harrison County, after the vessel has been anchored near the shore, and before any communication is allowed with the land. This second boarding is necessary, for some of these vessels might come directly into the harbor of Pass Christian, especially during the night, without having stopped at Ship Island. There are also two steamers running regularly, and making several trips a week, touching at our wharves to land freight and passengers: one running only between New Orleans and Ocean Springs, and the other between Mobile and New Orleans.

The rules and regulations of the National Board of Health will be carried out concerning these steamers, but it would be well to have an inspector both in New Orleans and Mobile to look after their freight and passengers before they leave those cities, and a certificate granted them by said inspector, to be handed by the captain in command to the health officer stationed at any of the coast landings, and by him examined into before any freight or passengers be allowed to come ashore. In case of necessity, such steamer will be ordered and accompanied by the health officer to Ship Island, cases of sickness taken care of, and the steamer treated according to the rules of the National Board.

The railroad cars and passengers coming from or going to New Orleans will also be looked after as soon as any cases of fever appear at any point on the road.

PENSACOLA, FLA.—Dr. R. B. S. Hargis, under date of May 23, makes the following report on this city:

Pensacola is situated on the north side of Pensacola Bay, nine miles from the entrance to the harbor. It is in latitude 30° 19′ N., longitude 87° 16′ 9″ W., and lies fifteen feet above the level of the water. Marshes of small extent appear here and there within the corporate limits of the city and vicinity. The soil bordering these marshes, consisting mostly of a sandy loam, is productive, and cultivated by the horticulturists with abundant success. Malarial affections prevail in the vicinity of these cultivated tracts in the latter part of summer and during the fall until frost appears, but are of a mild type, and tractable under judicious treatment. It is scarcely necessary to say that by proper draining malarial diseases in these localities would become extinct.

The number of inhabitants of Pensacola is estimated to be, in round numbers, about 10,000. These figures include the transient or floating population; the number of settled residents being computed at about 8,500, of which the colored portion of the population may be set down at one-third of that number, say about 2,800.

For nearly thirty years the writer has taken a deep interest in vital statistics, and has kept, or caused to be kept, a systematic necrological record. He has also noted in connection with the death-rate the concurrent prevailing diseases, and studied them in their relations to meteorological phenomena and also with regard to race, and the habits, mode of living, religion, and morals of the people generally.

The prevailing diseases of Pensacola from the 1st of January to April 30, 1880, may be put down in the order of their frequency or greater prevalence: Firstly, affections of the mucous surfaces, especially of the air passages, namely, bronchitis; influenza; pharyngitis, associated frequently with tonsillitis; laryngitis (croup); gastro-intestinal disorders. Secondly, hemorrhagic affections, as menorrhagia, which occurred so often as to attract the attention of physicians generally; epistaxis, and purpura hemorrhagica. Frequent abortions have been noticed. Acute diseases of the parenchymatous organs were rare, whereas chronic affections of the lungs, liver, and kidneys, also of the bladder, were aggravated. The fatal tendencies of phthisis pulmonalis were hastened. Consumption rarely occurs among the natives of Pensacola, and even when hereditary is slow to develope or remains dormant for a long period. Several native families, born of parents who died of phthisis, are now living who have passed the meridian of life, and still enjoy apparently good health. Among the "freedmen," or those who were formerly slaves, consumption is now common, whereas before the war between the States it was rarely met with. This is doubtless owing to the change in the mode of living, dissipation, vice, indiscriminate and illicit sexual intercourse, and a residence in low, filthy, unventilated habitations. Many, however, of the colored race emulate the best classes of the white population in the attainment of the comforts, conveniences, and luxuries of life, as well as a high moral and social standing among themselves, and therefore escape the ills that afflict the unfortunates above mentioned.

Although the atmosphere of Pensacola is more humid than that of some other places in Florida, many strangers who resort here for the restoration of their health realize a gradual and apparently permanent recovery. Persons in the incipient stage of consumption, for example, commonly recover sooner or later, but those whose lungs have begun to disintegrate, or who are in the more advanced stages of the disease, as a rule, get worse, and early succumb. Their native place, wherever it may be, is the best place for all such invalids.

The following meteorological summary, kindly furnished me by the observer of the United States signal office at Pensacola, Sergeant Robert R. Martin, together with remarks on ozone, and the tabular statement of the mortality in Pensacola annexed, will afford interesting study in connection with the diseases that prevailed concurrently with the jottings of the meteorological observer and vital statistician:

Meteorological summary, 1880.

Month.	Barometer.				Temperature					Monthly mean humidity per cent.	Average cloudiness, in tenths.	Rainfall, in inches and hundredths.	Prev. sailing wind.
	Monthly mean.	Highest.	Lowest.	Range.	Monthly mean.	Highest.	Lowest.	Range.	Greatest daily range.	Least daily range.

Enteritis	2	1	3	
Vulnus contusio	11	.....	1	In calculating the death-rate per 1,000 I exclude the death by contused wound (1), it being a case of homicide, which reduces the death-rate of Pensacola to 4 per 1,000 precisely, for four months.
Morbus cordis	1	.....	1	
Apoplexio cerebralis	1	.....	1	
Total	30	11	41	

I have no doubt but that the meteorological conditions of the atmosphere, in which that very important element ozone played an active part as a factor, were influential in the production of the diseases and mortality which occurred during the same period.

Ozone taken into the system in excess increases blood pressure or vascular tension, augments tissue changes, and thereby tends to the production of local congestions resulting in various morbid states of

the system. So that while ozone is necessary to life, conservative of the healthful performance of the bodily functions, it becomes by excess powerfully destructive, and by deficiency lessens the oxidizing action of the air on noxious compounds, and thus favors the spread of epidemic zymotic diseases.

According to the observations of Schönbein, Watson, Ross, Fox, and others, ozone certainly has an influence on health and disease, and it should, therefore, be entitled to a place in the memoranda of the meteorologist. Observations made by myself, taken by Schönbein's test-paper, and compared with Prof. R. C. Kedzie's ozone scale, and studied in connection with prevailing diseases since 1876, have impressed me with the belief that ozone constitutes an active factor, when in excess, in the production of catarrhal affections and other morbid states of the body, as already indicated, and when absent possesses an important connection, negatively, with cholera and yellow fever, favoring their propagation and spread.

The quarantine at this port went into operation on the first instant and is to remain in effect till raised by the board of health. Dr. T. M. Leonard, the former incumbent, was appointed to take charge of the establishment. The quarantine, as conducted by Dr. Leonard during the preceding ten years, was a complete success, notwithstanding there was a lack of harmonious action between the officials and employés. The discriminating powers of the quarantine physician were too limited, and consequently vessels were detained, against his judgment, longer than were necessary, and fumigation was had recourse to in instances where that officer had good reasons to oppose or protest against it.

In 1873 yellow fever was brought to Pensacola by the ship Golden Dream, which had been quarantined for twenty-four days, and in the mean time cleaned out, fumigated, and whitewashed. The disinfecting process in this instance was a complete failure.

I am now fully convinced that Professor Gamgee's method of destroying contagion and infection in ships and in houses by refrigeration, &c., promises better success and at less cost than any other means that have ever been applied. That other means have succeeded, I have already publicly declared; but those means require much more time and money than that which the professor has proposed. Frost destroys infection diffused through the air, a fact universally admitted, and a low temperature kills it effectually in houses. It is much to be regretted that the appropriation made by Congress last year for the building of Professor Gamgee's refrigerating ship was not applied.

Dr. T. M. Leonard, quarantine officer, reports for the week ending June 26 the arrival of 7 vessels at quarantine. Of these, four received free pratique after examination; of the three detained none are reported as infected.

Tarrytown, N. Y., July 3.—Dr. N. H. Freeland, health officer, reports 4 deaths and 7 births for the month of June. The town is remarkably healthy, and free from epidemic diseases.

ABSTRACTS FROM CONSULAR REPORTS.

Antwerp, Belgium.—United States Consul J. H. Stewart, in his report for the week ending May 22, states that small-pox has been increasing there for some time. There were reported for the week 108 cases and 38 deaths from small-pox; the authorities seem to pay no attention to the disease and clear bills of health are still issued.

Barbadoes, West Indies.—The report of United States Consul W. H. Polleys for the month of April gives a total of 52 deaths in a population of 20,000, being at the annual rate of 31.2 per thousand. General sanitary condition is reported good.

Bradford, England.—The report of mortality in this city for the year 1879 shows a total of 4,106 deaths in a population estimated at 191,046, giving an annual death-rate of 21.1 per thousand. This rate is lower than that of most other large manufacturing towns and 3.1 per thousand below the average in Bradford for six years past. Absence of extreme heat in the summer is regarded as the chief cause of the lessened mortality. The births in 1879 were 6,358, or at an annual rate of 32.7 per thousand, which was 5.9 below the mean of the previous six years.

Christiania, Norway.—United States Consul Gerhard Gade, under date of May 31, forwards the following account of an outbreak of small-pox in Christiania:

The president of the board of health of Christiania, Dr. Bidenkope, has addressed the following communication to the newspapers of this city:

"An epidemic of small-pox, which however has not yet spread much, has broken out in Christiania during this month. As the reports given by the newspapers have been erroneous, I will here give a brief history of this epidemic.

"At the beginning of May a sick seaman arrived here in the steamer Reserve. He was taken to the Central Hospital, where on the following day he was observed to have an eruption, which was considered to be measles, and he was consequently removed to the hospital of Ankerlökken. During his stay there, however, the disease proved to be small-pox, and the patient was sent to the small-pox lazaretto. Meantime he had, at the hospital of Ankerlökken, given the disease to a nurse and to the physician; the latter, however, had it in a very mild form, and they were at once isolated at the small-pox lazaretto. The seaman had been taken sick at Memel, Prussia. During the days between the 12th and the 14th May, the small-pox again appeared, and now on eight persons, occupied at the paper-mills of Bensberg. The almost simultaneous outbreak of the disease proved that these eight persons were infected at the same time and from the same source, which could not possibly be other than the rags of the paper-mill. Five of the persons attacked (women) had been working in a room where the rags were sorted. In that room twelve persons in all were at work, and thus half of them became infected. The sixth of the persons attacked had been at work in the adjoining room. The seventh (a man) had also been occupied with the rags. No particulars can be obtained about the eighth person. These eight persons lived all in different houses in the suburbs of Rodelökken and Sagan, and the contagious disease, which develops in the patients before the eruption appears, might then have spread in eight different houses, which were in a locality thickly populated. Another patient (the ninth) was afterwards discovered. She, too, had been at work at the mill, but had left, probably fearing to become infected, and thus several days elapsed before any information of her illness was received.

"Under these circumstances it might be expected that more cases would appear when the usual time of incubation had elapsed, as proved to be the case, since four persons were subsequently attacked. All the patients (in all sixteen) have been taken to the small-pox lazaretto.

"So large an importation of infection, of which from the outset at least ten different sources for the spread of the disease had been formed, has hardly ever before been observed in Christiania. Efficient measures have, of course, been taken to prevent further spread of the disease, but it can be easily understood that a further spread is to be feared, and it is most probable that the next few days will bring some new cases. It is, however, to be hoped that we may succeed in confining the sickness within its present limits. The most efficient means for preventing it are, of course, next to isolation of the patients and a perfect disinfection, vaccination and revaccination."

[Here follows information about the several places where vaccination can be done under direction of the board of health.]

"There is another circumstance which deserves to be noticed, namely, the danger which arises from the stores of rags at the paper-mills, as not only infection from the small-pox, as in the present case, but other dangerous diseases, may be brought from one place to another, as typhus, exanthematic-typhus, dysentery, cholera, splenitis, and pest. Up to this time the present instance has fortunately been the only one in this country, but such cases are sometimes reported from abroad. The rags which have spread the infection were probably white rags, imported from Stettin, and one of the bales had probably contained linen used by small-pox patients.

"It would be rather difficult to prevent in the future importation of diseases through rags which may arrive from other parts of this country, and particularly from abroad. During great and dangerous epidemics, as of cholera, importation of rags from suspected places ought to be altogether prohibited."

Glasgow, Scotland.—The United States consul forwards the report of the health officer for the year 1879, from which it appears that the death-rate for the year was 23 per thousand, having varied from 16.6 in August to 31.7 in December. The mean death-rate for 1879 was 6 per thousand below the average of the ten years preceding, while the rate under 5 years of age was 28 per thousand lower.

Leeds, England.—The report of the health officer for the five weeks ending May 1 gives a total of 576 deaths, being at the annual rate of 18.8 per thousand. Among the causes of death were consumption 50, other lung diseases 109, scarlet fever 11, measles 7, and whooping-cough 2. There were 239 deaths under 5 years, or 41.5 per cent. of the total mortality.

Montreal, Canada.—The United States consul forwards the reports of Dr. A. B. Larocque, health officer, for the first three months of 1880. The following items are noted: January—deaths, 310; under 5 years, 157; annual death-rate, 27.5 per thousand. Deaths from consumption 42, other lung diseases 38, small-pox 33, croup 7, diphtheria 7, scarlet fever 6, enteric fever 7, brain and nervous system 35, heart and circulation 13, and digestive system 12; premature births 5, accidental deaths 5. February—deaths, 343; under 5 years, 157; annual death-rate, 30.5 per thousand. Deaths from consumption 40, other lung diseases 59, small-pox 26, measles 16, croup 14, diphtheria 11, scarlet fever 3, enteric fever 4, brain and nervous system 54, heart and circulation 12, and digestive system 10; premature births 6, accidents 4. March—deaths, 330; under 5 years, 129; annual death-rate,

29.3 per thousand. Deaths from consumption 38, other lung diseases 47, small-pox 27, measles 20, diphtheria 15, croup 5, scarlet fever 5, brain and nervous system 41, heart and circulation 15, and digestive system 13; premature births 4, accidental death 1. The mean temperature for January was 22.4, February 19.9, March 22.1.

MOSCOW, RUSSIA.—The report for the month of January gives a total of 1,957 deaths in a population of 601,970, being at the annual rate of 39.0 per thousand. Among the causes of death noted are small-pox 12, enteric fever 114, other contagious diseases 172, digestive system 215, consumption 291, and other lung diseases 251.

NINGPO, CHINA.—United States Consul E. C. Lord sends reports for five weeks ending May 10. The usual diseases of large cities in temperate climates are noted, but no statistics can be obtained as to number of cases or mortality. The mean temperature was about 66°; the general sanitary condition is reported as good.

RIO DE JANEIRO, BRAZIL.—Under date of May 26, United States Consul Thomas Adamson forwards a letter (with translation) from Dr. Maximiano Marquez de Carvalho, setting forth the claims of a certain "prepared rosin" (or resin) as a specific for the prevention of yellow fever. He administers the resin by inhalation, and one application of the vapor is said to afford protection for a year. The Doctor claims by this means to have "extinguished in 600 houses the yellow fever which had previously appeared in them for 30 years consecutively."

SANTIAGO DE CUBA.—United States Consul J. C. Landreau, in his report for the month of May, records 76 cases of yellow fever, and 54 deaths; 102 cases of small-pox, with 52 deaths; and 16 cases of typhoid fever, with 8 deaths. The yellow fever and small-pox are said to be confined to the troops, and as no cases have occurred near the shipping, the consul continues to give clean bills of health to vessels bound for the United States. There were 241 deaths from all causes during the month, in a population of 40,000, being at the annual rate of 72.3 per thousand.

SHEFFIELD, ENGLAND.—During the four weeks ending May 8 there were 844 births, of which 440 were females; birth-rate, 36.1 per thousand. In the same period there were 537 deaths, the rate being 23 per thousand. Deaths from scarlet fever, 36; typhus and typhoid fevers, 18; diseases of respiratory organs, 45. Attention is called to the selling of newspapers by children, just convalescent from "fever," as a frequent means of spreading disease.

SINGAPORE.—United States Consul A. G. Studer reports for the month of April a total of 288 deaths. From "fever" 76, consumption 12, diarrhœa and dysentery 61, lung diseases 18, brain diseases 5, small-pox 3. No epidemic disease in the port. Of the decedents 3 were Europeans, 187 Chinese, and 61 Malays.

Under date of May 7, that the port and district are free from epidemic, infectious, or contagious diseases.

ST. JOHN, NEW BRUNSWICK.—The report of United States Consul D. B. Warner for the month of May gives a total of 61 deaths, but the causes are not stated, nor is any estimate of population given. No contagious diseases are reported.

ST. PETERSBURG, RUSSIA.—United States Consul W. H. Edwards reports 759 deaths for the week ending May 15; of this number 507 were males and 252 females. There were 155 deaths from typhus fever, and 119 from consumption; still births 26, accidents 11, suicides 4.

For the week ending May 22, deaths 689, rate 53.8; typhus 127, diphtheria 10, consumption 123, 43 still born, 6 accidental, 3 suicides.

For the week ending May 29, a total of 719 deaths in a population of 667,000, being at an annual rate of 56.2 per thousand. There were 166 deaths from typhus fever, 109 from consumption, and 113 from other lung diseases, 3 suicides, 6 accidental deaths, and 25 still-births are reported.

VALPARAISO, CHILI.—United States Consul L. H. Foote reports for the month of April 393 deaths, of which 63 were from small-pox; the disease is now rapidly decreasing. The annual death-rate was 46.6, the population being estimated at 101,100; the city is unclean and badly drained.

YOKOHAMA, JAPAN.—Dr. Thomas H. Streets, United States Navy, reports for the month of May 88 deaths from all causes. The native papers continue to report isolated cases of cholera in various parts of the empire, but Dr. D. B. Simmons, of the Kanagawa Ken Hospital, is inclined to doubt the correctness of diagnosis of the Japanese physicians in calling the cases true cholera.

Muscatine, Iowa, 7,500; deaths, 3; consumption 1, pneumonia 1. Muskegon, Mich., 13,000; deaths, 7; under 5 years, 2; diphtheria 1, malarial fever 3. Natchez, Miss., 10,000; deaths, 4; under 5 years, 1; diarrhœa 1, malarial fever 1, old age 1. Nebraska City, Nebr., 5,200; consumption 1, under 5 years. Ocala, Fla., 1,000; no deaths. Oshkosh, Wis., 18,000; deaths, 4; consumption 2, old age 1. Painesville, Ohio, 5,000; one death. Phœnixville, 6,000; measles 1, under 5 years. Pleasant Hill, Miss., 250; no deaths. Pontotoc, Miss., 600; no deaths. Port Gibson, Miss., 1,400; no deaths. Port Jervis, N. Y., 10,000; deaths, 2; under 5 years, 1. Pulaski, Tenn., 2,100; diarrhœa 1. Ripley, Miss., 1,000; no deaths. Rock Island, Ill., deaths, 5; under 5 years, 2; no population given. Rockland, Me., 7,000; deaths, 3; under 5 years, 1. Santa Cruz, Cal., 5,000; one death. Springfield, Ohio, 23,000; deaths, 11; under 5 years, 8; consumption 1, diarrhœa 8. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 3. Tampa, Fla., 1,200; no deaths. Titusville, Pa., 9,000; consumption 1. Victoria, Tex., 3,500; two deaths. Wesson, Miss., 2,000; no deaths. Youngstown, Ohio, 17,000; deaths, 3; consumption 2. Total population, 439,979; deaths under 5 years, 67; total deaths, 141; annual rate per 1,000, 16.7.

ADOPTION OF RULES AND REGULATIONS.

Extracts from the minutes of the board of health, Hancock County, Mississippi.

At a meeting of the board of health for Hancock County, State of Mississippi, held June 21, 1880, at Bay Saint Louis, the following rules relative to quarantine were adopted, viz: 1st. No vessel coming from any infected port will be allowed to enter the port of Shieldsborough (Bay Saint Louis) without the proper certificate from the physician of the National Board of Health at Ship Island.

2d. All vessels arriving within the waters of Hancock County from infected ports, without the proper certificate from the physician of the National Board of Health at Ship Island, will be compelled to proceed there without delay, and report to the physician in charge, to be cleansed and disinfected. These rules to be in force until the 1st day of November, 1880.

On motion, it was resolved that the president of the board be required to visit each and every vessel arriving from any infected port, and act in accordance with the rules and regulations heretofore adopted.

INSPECTORS' REPORTS.

NEW ORLEANS, LA.—Dr. C. A. Rice reports for the week ending June 20, the inspection of 15 steamboats, 7 barges, 1,292 persons. Tonnage 13,143. Average condition good. Trains inspected 31. One thousand four hundred and eighty-nine boxes fruit direct from Sicily passed for Memphis, which city excludes only tropical fruits.

For the week ending June 28, the inspection of 19 steamboats, total tonnage 16,022, and 10 barges. Total number of persons 1,454. Average condition of boats and barges good. In the railway-inspection service there were 33 freight trains inspected. No suspicious cases are reported in the city.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JULY 17, 1880. [No. 3.

CLIMATE AND DISEASES.

[By CLEVELAND ABBE, M. D.]

The following paper was read before the Convention on Vital Statistics, which met at the rooms of the National Board of Health, May 6 and 7. The diagrams and charts referred to in the paper are omitted here, not being convenient for publication in the BULLETIN.

I. Having been requested by the President of the National Board of Health to present a few remarks "on the possible relations between meteorological data and vital statistics, and especially on the graphical method of presenting this data," I have therefore given this subject some consideration, and by way of an introduction to your deliberations submit the following remarks and suggestions with much diffidence, as coming from one who can have no claim to being an expert in these matters. The subject, indeed, is by no means a new one, but possesses rather a very long list of authors and titles, to all which I need not now refer.

Now, I shall not pretend to review the literature of the subject or to review all our knowledge of the relations of meteorology to health, but I shall assume that we, to-day, desire only to consider how far the study of climate may be reasonably expected to assist the physician in determining the ultimate cause of diseases and in applying the remedy. I must, therefore, first speak of a few hazy and imperfect or wholly erroneous ideas that must be cleared away before we can decide what is at present demanded of us by way of observation, and what graphic or statistical methods are to be recommended. These erroneous views on the relations of climate and health may seem hardly worth combating, but you will see that they have been so extensively repeated by eminent writers that it may well be feared lest the search after the truth has been long delayed by such dissemination.

II. I will first remark that there certainly has for ages been prevalent an opinion that certain climates are beneficial to invalids, and the sick have been transported thither with good results. But in doing this it has all along been quietly implied, and by many well understood, that the beneficial effects were due not to the climate in itself but wholly to the influence on the patient of *a change of climate*, if not indeed to other wholly extraneous conditions, such as bathing, freedom from dust, malaria, &c.

The numerous geographical and statistical comparisons that have been collected by so many students of this subject have, so far as I have examined them, nothing in them to show conclusively that the annual average temperature, moisture, wind, pressure, cloudiness, sunshine, &c., have in themselves anything more than an infinitesimal influence upon health, disease, or death, and yet these statistical authors have frequently lost sight of the distinction between the effect of a uniform climate and of a very changeable one, or rather, to be more charitable, they found the statistical material at hand in a shape that rendered it too laborious or impossible to separate the changeable from the uniform.

As an illustration of this very common class of errors, I will quote from a well-known author (Dr. Fox, of London), who, in his little pamphlet on the humidity of the air of Scarboro, formulates the connection between humidity and health, as follows:

First. A preternaturally dry air, with a high temperature, is apt to give origin to fevers and intestinal disorders.

Second. A very moist atmosphere, accompanied by a low temperature, predisposes to bronchial and rheumatic affections.

Third. A very dry atmosphere, when associated with a low temperature, excites inflammations of the respiratory organs.

Fourth. Humid climates and excessive rainfall, by producing a damp, foggy, relaxing climate, exert an injurious influence on the health, depressing the nervous system and checking the cutaneous and pulmonary exhalations.

Fifth. Abundant rainfall diminishes cholera, diarrhœa, and typhoid fever.

These and similar statements, illustrate the difficulty of our subject, and show how easy it is to confound causes, effects, and concomitants.

There certainly is not one of the preceding five propositions but is negatived by the common experience of the residents of the United States.

First. The dry air of our driest regions is universally extolled for its healthy, invigorating qualities; and intestinal disorders, if they prevail, are attributed to the drinking water, and not to the atmosphere.

Second. Rheumatism and bronchial troubles are in the minority in very warm, moist climates, such as our own Gulf coast, and if they prevail in New England, are attributed to the sudden daily changes in the weather, and very, very often to heredity.

Third. The dry, cold winter air of Minnesota and Manitoba is borne with impunity and pleasure by every one accustomed to it, and the inflammations of the lungs that occur there have always other and special causes.

Fourth. Humid climates may be and are depressing to those accustomed to a dry climate, but in the natives of Iceland, the Hebrides, Orkneys and Shetlands, Bermudas, Bahamas, and the islands of the Pacific and Indian Oceans, we behold races of men who have not yet been shown to be peculiarly subject to nervous, cutaneous, or pulmonary disorders.

Fifth. The diminution of cholera, diarrhœa, and typhoid fever during rainy seasons, if it be a fact, is more likely to be a secondary effect, due to the more abundant washing and drainage, rather than to any direct influence of rainfall upon the human body; and the diminution is, moreover, largely balanced by the fact that excess of rainfall often operates, by causing overflow of cisterns, to spread the germ of these diseases throughout large masses of otherwise innocuous drinking water.

By these remarks, I would not be misunderstood, but repeat that the average annual temperature, moisture, &c., whatever indirect effects they may have—and these must be conceded by every one—have little or no direct bearing upon the prevalence of any special disease. Perhaps the best proof of this proposition, if it need any, is found by comparing the climates of those regions in which certain diseases are rare, with the records of other regions in which those same diseases are frequent. This I need not do in detail, for the peculiarities of many diseases have come to be so well known that instances will crowd upon your memory to show that neighboring localities, having precisely the same meteorological climate, are in one case exempt, and in the other frequented by given diseases. The fact is, that human beings are capable of becoming acclimated to any uniform condition of the atmosphere, and of living long, healthy lives either on high, dry, sunny plateaux, or on low, damp, foggy seashores; but this vital power of adjustment to our surroundings is very severely tried when at any place we experience *sudden changes* in the atmospheric condition, and it is *then* that the physiological system proves inadequate and becomes disordered.

III. The sudden changes to which I refer are not the gradual and regular annual changes, but they are irregular, or non-periodic changes; and here at once I have to say a few words in reference to another class of very laborious statisticians. Of these, I may take, as a prominent example, the Medico-Climatological Committee of the Scottish Meteorological Society, of which Dr. Arthur Mitchel, of Edinburgh, is the chairman. Dr. Mitchel, with the assistance of Buchan, the well known meteorologist, has published most elaborate tables, embodying the results of years of labor in studying the weekly mortality returns for London for the thirty years, 1845 to 1874, inclusive. (See The Influence of Weather on Mortality, Jour. Scot. Met. Soc., Feb., 1875, vol. 4, page 185; The Mortality of the large towns of the British Islands, vol. 4, page 307; The Mortality of New York and London Compared, *ibid*, 1878.)

In the first of these papers the authors state "that the primary object of the inquiry is to investigate the seasonal influence of climate on death-rate from different diseases." They accordingly give both in tabular, and in graphic form, the numerical distribution, by weeks, throughout the year, of deaths from different diseases, or from special groups of diseases, as also the deaths of old, and of young, and of male, and of female; they analyze minutely the mortality returns for London, and collate with these, by tables and curves, the mean temperatures, humidity, &c., for thirty years. In the accompanying diagrams, Nos. 1 to 6, I have reproduced some of their results.

You will notice upon these diagrams many remarkable coincidences, all of which have been fully dwelt upon by our authors, and which constitute a very complete description of the parallel courses taken by mortality and climate. But such a descriptive process does not possess any of the characteristics of an investigation into the influence of climate on the death rate, nor does it give the least positive proof of the actual effect of any such influence. In fact, the authors start with the assumption that there is such an influence;

they put the data at hand into perspicuous graphic shape; call attention to some remarkable coincidences, and there suddenly stop, leaving it for others to show that the data prove or disprove the original working hypothesis.

But, inasmuch as our health is affected no more by what the skin feels, than by what the stomach drinks and eats, or the lungs breathe, and as these two additional modes of imbibing disease and death also are subject to seasonal changes parallel to the meteorological phenomena therefore the statistical student must first show us how to separate one influence from the other better than he has hitherto done, if he would succeed in adding to our positive knowledge of the causes of disease and death.

For example, we see conspicuous, the great mortality of children under five years of age culminating the first week in August, and due only to diarrhœa, and about eighty per cent. of which is confined to infants under one year. Now, what proof is offered that this is due to the extreme heat of those weeks in London in face of the other equally important factors such as acid fruit, unripe fruit, soured milk, tainted milk and food, spore dust in the atmosphere, and other causes, all which have their culmination and maximum influence, almost exactly simultaneously with each other, and with the temperature? and yet our authors boldly state, on page 230, "it is not cold, but heat which is the great destroyer of the infant life of London." The utter want of logic, the perfect *non sequitur* of this conclusion is but little ameliorated by the fact that on the next page the authors do allow that the influence of food and nursing needs to be investigated.

The fallacy of such conclusions is revealed at once if we supply the omitted premise, and the reasoning would stand thus:

Diarrhœa prevails in hot weather.

Every other conceivable cause has been examined and proven to be harmless.

Therefore heat causes diarrhœa.

Certainly no one will be found to maintain the truth of the premise that we have here had to supply.

More guarded is the similar remark, on page 50, of the report for 1872 of the board of health of Philadelphia, where, under the heading of "Causes of death from cholera infantum," we read as follows: "In the development of cholera infantum a high degree of temperature and excessive humidity act as powerful predisposing causes." But when the authors add, "We are not at a loss in assigning the reason for the exceptional increase in the death-rate of this disease, when we consult the meteorological observations for the year," we cannot but wish that they would more clearly show us whether the oppressive heat does not affect the mother and the child's food far more than it does the babe directly. They probably meant to say that the CHANGE FROM SPRING TO OPPRESSIVE SUMMER WEATHER, which was remarkably severe in 1872, induces the predisposition to diarrhœa, but even in this shape we see no reason to accept the statement as logical conclusion. In fact, I dare to say that the meteorological statistics prove clearly that great mortality from *cholera infantum* does not always or necessarily prevail in hot weather, so that the conclusion that heat causes diarrhœa absolutely loses both of its supporting premises and falls flat to the ground.

For instance, examine the unprecedented mortality from cholera infantum, as given in the Philadelphia report for 1872, and as reproduced in the accompanying diagram, No. 7. This diagram shows also the curves of the daily maximum and minimum temperatures for the Washington Naval Observatory, which will not differ greatly from the curves for Philadelphia, for which I have not the necessary data at hand at the moment of writing. The first feature that strikes the student is the maximum mortality of July 6 and 13. Next comes the fact that the equally hot or hotter periods in May 6–12, June 6–14, August 7–15, and 17–27 and September 6–10, were not attended by any special increase, but rather a very decided decrease or absence of cholera infantum, whence we can infallibly conclude that high temperature has, in itself, very little direct influence on the disease, and this becomes clearer when we reflect that the actual mortality occurs always some time after the disease has taken hold upon the child, and that the maximum mortality of July 6 occurred two weeks after the remarkable sudden fall of temperature that is shown to have occurred on June 22 and 24. I must maintain, therefore, that it is a perfectly plausible hypothesis that the sudden change from hot to cold on that date was the cause of many infants or their mothers taking cold, which settled in the bowels, and that the disease ran along with no more than the ordinary mortality, until the sudden increase of heat on July 6 caused the mothers to yield to the temptation of a change of diet from one of animal food and ripe vegetables to one of fresh vegetables and fruit, a change that assuredly always affects the babe far more than the direct influence of the temperature. Why will not some one compare the statistics of cholera infantum with the daily sales of cherries, cucumbers, green apples, &c.? I predict some very important coincidences will be revealed.

I may remark that the diagram here given shows also the minimum temperature of each day, but as the babe is usually well protected against the cold of early morning, and is exposed to the free air only during the warmer part of the day, it is evidently proper for us, in this case, to confine our attention to a comparison of the curve of mortality with that of maximum temperature.

IV. I therefore repeat the conclusion previously given in this paper, that these masses of statistics do not prove that the average annual temperature, or the regular seasonal variations from mid-winter to mid-summer, have any direct effect on human health, but only show that there is for each disease a systematic periodicity; the causes of this periodicity, as it seems to me, can never be revealed by any such simple statistical processes. And yet it is the cause and the remedy that is the great object of our search, and we meet to consider the question how far the results of statistical comparison between weather and disease justify further labor in that line, or whether they point towards other lines of research.

On this question I will not long detain you with reasonings, but will directly express my own convictions in the following sentence: The students of climatological statistics have as yet proved nothing as to the origin, cause, or prevention of disease; it is only by studying the minute details of irregular sudden daily changes that we can hope to demonstrate the direct influence of the atmosphere, or to show those geographical regions to which, in a very limited class of diseases, patients may be advantageously sent for a beneficial change.

V. Since, therefore, our studies of climate and disease give us no satisfactory answer to the questions that we have at heart, we perceive that we must pursue a very different line of investigation. We must first inquire of the experimental students of human physiology as to the cause of disease, and as to what climatological features are of importance, and then turn to the meteorological records to find them, if we can—not to take the monthly averages that the meteorologist has prepared for his own special use.

I find that the following purely climatic considerations are the principal ones that experience and experiment have shown to directly affect the human system after it has once become acclimated to any given conditions:

1. Long-continued extreme hot weather, with light winds and calms, producing nervous debility.
2. Long-continued extreme moisture, checking perspiration and throwing back into the system the heat that would have been absorbed with evaporation.
3. Sudden changes from cool to hot.
4. Sudden changes from hot to cold.
5. Sudden changes from dry to moist.
6. Sudden changes from moist to dry.

In addition to these changes, those also from high to low or from low to high pressures are shown by many investigators to have probably a decided effect upon the organs of breathing.

In general, these six or eight conditions reduce to two or four, as most climates unite the change from cold to hot with the change from moist to dry, or *vice versa*; and in general, the atmospheric changes here specified determine the direct effect of the weather upon human health; and if we would bring out quantitatively the actual bearing that these features have upon humanity, we must not hide them under a mass of mean monthly or annual temperatures and humidities.

VI. If it be considered desirable to especially determine these particular features of any climate, the apparatus would be of the simplest kind, namely:

1. A self-registering maximum thermometer.
2. A self-registering minimum thermometer.
3. A maximum and minimum hygrometer; the hair or vencer hygrometer, having sliding indexes to record the extremes.
4. A self-registering maximum and minimum aneroid barometer, one having sliding indexes to record the extremes.

The observers' duties would consist in the record once a day, say at 9 p. m., of the indications of these instruments.

The statistician would then make out tables of the greatest range of temperature from the morning minimum to the afternoon maximum, and from the afternoon maximum to the next morning's minimum, together with any other items suggested by the physiological student.

VII. These items include, I believe, all the features of climate that directly affect human health, and the best method of presenting them in graphic form to the eye is simply a repetition of the maximum and minimum curves, illustrated by the diagram No. 7, or by a corresponding condensation from a daily into a monthly summary.

VIII. In conclusion, I must commend to your notice the well-weighed words of Dr. J. Shreiver, of Vienna, in a lecture on this subject in 1876, which, at my suggestion, has been translated, and made accessible to American readers, by Dr. Geddings, and in which the author maintains that we are wholly on the wrong path when we confine ourselves to comparing meteorological observations with medical statistics; and "that the term climate, which has been hitherto employed to denote a vague, indefinite specific, of which no rational account could be given, appears now as something infinitely clear and very simple, being in fact nothing more than pure air, uncontaminated by miasma, with no organic or inorganic substances, and one in which rain is not unduly deficient."

Note added in June, 1880.

The preceding paper deals only with the question of the direct influence of climate on health. It was not the author's intention at the present time to propose definite hypotheses in reference to germs or the numerous other indirect influences, but to show that certain

diseases mentioned by him, and probably many others not mentioned, must logically or, as he believes, reasonably be attributed to the direct action of climate; that, therefore, we must turn our attention more than ever to other sources of disease.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

OAKLAND, CAL., June 26.—Dr. E. H. Woolsey makes the following remarks on the value of reports from the public schools of absence on account of sickness:

In the NATIONAL BOARD OF HEALTH BULLETIN of June 12 (p. 407) you will observe that my report is the only one giving absentees from public schools on account of sickness. As far as I know this method of estimating the sickness of localities has not been hitherto introduced. Frequent unsuccessful attempts have been made to induce or compel physicians to report their cases; but from many causes the majority of physicians could not be induced to make such reports, and the data furnished by the few medical men who appreciate the importance of ascertaining the topographical ranges and limits of disease are far too meager to be of any practical importance or value, and such, I believe, has been the uniform result of all efforts in this particular direction elsewhere. Being anxious to locate the sickly districts of our city, in order to carry out effectively a projected sanitary reform where most needed, the method which we have adopted occurred to me the most reliable and the least troublesome in practical operation. This portion of the report always finds its way into the newspapers as a matter of local interest, and in this way is exerting a salutary influence and one which was unforeseen, viz., that of inspiring voluntary efforts for reform. Like the publication of the mortality and the sanitary inspection of wards, it suggests that healthy localities and healthy soil and healthy houses are likely to become more desirable and command better prices.

The report of the sickness in the schools is furnished me by the school superintendent, he requiring the principals of the schools to include in their monthly reports to him the number of scholars taken sick during the month. Thus it will be seen that there is no difficulty in obtaining the required data, and these data must be universally regarded as more reliable and complete than could be obtained from any other source, and therefore form a safe and proper basis for an estimate of sickness.

While it is possible under this arrangement that some pupils are excused for feigned sickness, its workings are nevertheless uniform and equal and give results which accorded almost perfectly with the mortality and known sanitary and unsanitary conditions.

Now it is possible through the school department to obtain still further information in regard to the sickness of the different sections of the city. For example, the school superintendent might require reports from the principals, made out on blanks furnished by the health officer, giving the number sick from different diseases, duration, and result of illness. If this practice were general throughout the United States no objection could be raised, and it would doubtless meet with general favor and adoption, and would be productive of very valuable results.

YELLOW FEVER REPORTS.

NEW ORLEANS, LA.—A dispatch from Dr. S. L. Bemiss, member of the National Board of Health, dated July 11, reports one case of yellow fever on board the *Excelsior*, from Rio Janeiro. The case was at once removed to hospital, and the city is reported as healthy.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

Winona, Minn., 10,000; no deaths. Youngstown, Ohio, 17,000; deaths, 2; under 5 years, 1; consumption 1, diarrhœa 1. Total population, 467,732; deaths under 5 years, 69; total deaths, 157; annual rate per 1,000, 17.5.

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—The report for the month of May gives a total of 394 deaths, of which 48 were caused by consumption, 12 by typhoid fever, 10 by diphtheria and croup, 5 by whooping-cough, 7 by small-pox, and 7 by diarrhœal diseases.

GUAYMAS, MEXICO.—The reports for the five months, from January 1 to May 31, show that this port has been free from yellow fever and other contagious diseases during that time. Only 30 deaths are reported, but it is not to be supposed that this is a correct report of deaths in a population of 5,500.

JACMEL, HAYTI.—The reports for the three weeks, ending May 29, show that the town is free from yellow fever and epidemic diseases, but no records of mortality are kept by the authorities.

MAURITIUS.—The report of United States Consul H. C. Marston for the month of April gives a total of 912 deaths, of which 540 were caused by "fever." The population of Port Louis is not given, but may be deduced from the annual rate of mortality, which is stated to be 30.6, corresponding to 912 deaths for the month.

MESSINA, SICILY.—For the month of March 242 deaths are reported, of which 7 were from typhoid fever and 43 from other contagious diseases. The death rate per annum was 37.6 per 1,000. In April there were 183 deaths, of which 10 were caused by typhoid fever and 30 by other contagious diseases, the annual death rate being 28.4 per 1,000.

PARA, BRAZIL.—United States Consul A. C. Prindle reports 127 deaths from all causes during the month of May. No epidemic or contagious disease prevailed, and malarial fevers are noted as the principal cause of death. The annual rate of mortality was 38.1 per 1,000.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JULY 24, 1880. [No. 4.

REPORT ON DISEASES OF DOMESTIC ANIMALS.

[By JAMES LAW, Professor of Veterinary Medicine in Cornell University.]

DR. J. L. CABELL:

SIR: In compliance with your request, I respectfully submit the accompanying statement as to how far in my opinion the functions of the National Board of Health must embrace a superintendence of the sanitary condition of the domestic animals. I have considered such animal diseases as determine specific and communicable disorders in man, and have sought to point out in what cases the gravity of the affection would demand the interference of a health board. A large number are mentioned over which a national board of health must exercise a careful supervision if they would fulfil their trust; and to enable them to accomplish this, Congress must give them power to add to their number men who have made a special study of animal diseases, and who are prepared to cope with them successfully. I have further sought to show how essential it is that a board so constituted should be invested with executive power and not left as a mere advisory body, which must lose in intelligence, efficiency, and esteem in proportion as it is debarred from the practical work of overcoming insanitary conditions and of instituting experiments to determine the best methods of sanitation.

Finally, I have entered on the question of those affections of the domestic animals which are not communicable to man, but are transmissible from animal to animal so as to constitute veritable plagues and to undermine our agricultural prosperity. As agricultural success is the true basis of all national prosperity, the suppression and extinction of these animal plagues is a work only secondary in importance to the arrest of epidemics, as national wealth is only second to moral advancement.

Here arises the question whether a board of health already constituted to deal with a certain number of animal plagues is not the most economical and efficient medium through which to deal with all, and whether the whole subject of animal sanitation should not therefore be placed in the same hands. In seeking to take an impartial view of this matter I have taken into account the financial interests involved and the necessity for a representation of these interests in any organization appointed to deal with the subject. I have also considered the great expenditure necessary to a prompt extinction of the exotic animal plagues, and the need of an executive head who can act promptly in every emergency and without the fatal delays that would attend on calling meetings of a health board whose members reside at long distances from each other. Also the vast importance of a speedy extinction of exotic plagues before they can gain a footing on the plains and boundless unfenced pasturages of the West and South, from which it would be hopeless to attempt their extermination. And, finally, the imperative need of prompt and effective work in order that the country may be made aware of the advantages of such an executive, and that there may be no excuse for a temporary—perhaps a final—abolition of the organization before they have had an opportunity to exterminate a single plague, and thereby to demonstrate their value to the nation.

In view of these and other considerations an opinion is respectfully submitted which is, at least, the result of no hurried conclusion, but of careful deliberation.

LIST OF COMMUNICABLE ANIMAL PLAGUES.

As the magnitude and gravity of this subject is but little appreciated, it will be best introduced by stating, in tabular form, the diseases of the domestic animals that are known to be communicable to man, and those which are intercommunicable between animals only. Afterward, the question will come up as to which of these diseases will demand the supervision of a health board, and under what circumstances.

A.—*Contagia common to man and animals.*

1. Glanders and farcy in horses, &c.
2. Canine madness, rabies in dogs, cats, &c.
3. Malignant anthrax in all domestic animals.
4. Tuberculosis in all animals.
5. Asiatic (malignant) cholera in all animals.
6. Milk-sickness in cows and other animals.
7. Small-pox in chickens, pigeons, &c.
8. Eczematous (aphthous) fever in bisulcates, &c.
9. Typhoid fever (?) in sucking animals.
10. Diphtheria in animals.

B.—*Parasites common to man and animals.*

1. Echinococcus in animals; Tænia echinococcus in dogs.
2. Cysticercus cellulosa in swine; Tænia solium in man.
3. C. medio-cannellata in calves: T. medio-cannellata in man.
4. C. tenuicollis in man, sheep, &c.; T. marginata in dog.
5. Tænia elliptica in man and cat.
6. Bothriocephalus latus in man, dog, &c.
7. B. cordatus in man, dog, &c.
8. Trichina spiralis in swine, &c.
9. Tricocephalus dispar in man and pig.
10. Strongylos gigas in man, horse, ox, and dog.
11. Ascaris mystax in cat and human being.
12. Fasciola hepatica in man, herbivora, and omnivora.
13. Distomum lanceolatum in man, herbivora, and omnivora.
14. Pentastoma tænioides in man, dog, sheep, &c.
15. Sarcoptis mutans in chickens and man.
16. Demodex folliculorum in dog, sheep, and man.
17. Œstrus bovis and other cuticolla in cattle and man.
18. Gregarina in man and animals.
19. Tricophyton tonsurans in man and animals. (Tinea tonsurans.)
20. Achorion schönleini in man and animals. (Tinea favosa.)
21. Microsporon adouini in man and animals. (Tinea decalvans.)
22. Oidium albicans in man and animals. (Thrush, muguet.)

C.—*Contagia communicable from one animal to another.*

1. Texas fever in cattle.
2. Swine plague. Intestinal fever of swine. Hog cholera.
3. Bovine lung plague. Contagious pleuro-pneumonia in cattle.
4. Rinderpest in cattle and other ruminants.
5. Sheep-pox. Variola ovina.
6. Swine-pox. V. suilla.
7. Cow-pox. Horse-pox.
8. Venereal disease of stallions. Dourine.
9. Foot-rot in sheep.
10. Strangles in horses.
11. Influenza in animals.
12. Infectious mammitis in cows.
13. Parturition fever in ewes.
14. Quebra bunda in horses.
15. Horse sickness of South Africa.

D.—*Parasites causing enzootics in animals.*

1. Scabies acariasis:
   - In sheep: Follicular scabies. Demodex folliculorum. Scab. Dermatocoptis ovis. Dermatophagus ovis. Black nose. Sarcoptis ovis. (Leptus Americani ?)
   - In horse: Mange. Sarcoptis equi. Dermatocoptis equi. Poultry mange. Dermanyssus avium, &c. Foot mange. Dermatophagus equi.
   - In ox: Mange. Dermatocoptis bovis. Foot mange. Dermatophagus bovis. Poultry mange. Dermanyssus avium, &c.
   - In pigs and dogs, mange. Sarcoptis suis (Squamiferous.)
   - In dog: Mange. Sarcoptis squamiferous (Suis). Follicular mange. Demodex folliculorum.
   - In cat and rabbit, mange. Sarcoptis nivar.
   - In chicken, scabies: Sarcoptis mutans. Dermanyssus avium.
2. Lung worms:
   - In sheep, goat, and camel: Strongylus filaria. Strongylus filaria, varietas longus. Strongylus Africana.
   - In horse and ox, Strongylus micrurus.
   - In swine, Strongylus elongatus.
   - In birds, gapes. Sclerostomum syngamus.
3. Sclerostomum hypostomum in sheep.
4. Strongylus filicollis in sheep.
5. Strongylus contortus in sheep and cattle.
6. Sclerostomum equinum in horse.
7. S. tetracanthum in horse.
8. S. suis in swine.

9. Tricocephalus affinis in cattle and sheep.
10. Stephanurus dentata in swine.
11. Echinorynchus gigas in swine, cockroach, ladybug, &c.
12. Ascaris suilla in swine.
13. Tænia expansa in sheep and cattle.
14. Cœnurus cerebralis in sheep, cattle, dogs, &c.
15. Œstrus ovis, grub in the head, in sheep.

In presenting this formidable list of diseases it must not be supposed that we advocate an immediate resort to suppression of the whole. A very few only will demand prompt and active suppression. For others, even of the most dangerous character, there is only wanted a guardiancy over trade to prevent the importation of disease or its extension into regions where it would be seriously detrimental. While for most places it will be at long intervals only and in special conditions that the resulting disease will arise to the dignity of an epizootic or epidemic and demand executive interference, yet there are few maladies mentioned above that may not and do not in particular circumstances attain to such dimensions, and a national board of health, charged with the supervision of the sanitary condition of animals as well as men, must be prepared to meet and successfully deal with any one of the above affections to which the human being is subject. Similarly, must an organization, formed to deal with the plagues peculiar to animals, be prepared to deal with any one of those affections when it attains to dangerous proportions.

GLANDERS AND FARCY.

This affection, which so remorselessly ravaged the cavalry regiments and mule trains during the recent American war, was, at the return of peace, scattered widely over the continent. In country districts we continually see it cropping out, and whole studs falling victims to its ravages, while in city car-stables hundreds are not unfrequently slaughtered to arrest the progress of the scourge.

The subjects of the slight and chronic attacks are frequently taken to a distance and sold as sound animals to unsuspecting purchasers, whose health and lives are thus too often sacrificed to satisfy the cupidity of an unscrupulous vender; for this terrible malady is as painful, loathsome, and fatal to the human system as to the equine, and every veterinarian of extensive practice can adduce instances in which men have perished miserably from the equine infection.

Were it only for the money losses inflicted by this scourge, it would demand the prompt destruction and safe disposal of every infected animal.

At the beginning of the present century, horses suffering from chronic glanders were habitually kept and worked in Great Britain, and the losses throughout the island were enormous. Now, where it is illegal to keep a glandered horse, these have been reduced to a very limited number. In the English army, where the presentation of symptoms equivocating glanders entails the prompt slaughter of the subject, this disease has been definitely eradicated, and a former loss of ten per cent. per annum has been entirely obviated. When we add to this the moral and economic considerations of the preservation of human health and life, the demand for the instant destruction of animals afflicted with this disease becomes imperative. A statute looking to this end is demanded in all States in which it has not been already enacted, and it becomes the duty of the National Board of Health not only to urge the passage of such a protective law, but to see that it is properly administered. That such a supervision is necessary may be inferred from the facts: 1st. That many of the most dangerous forms of glanders show deposits only in the lungs, testicles, or other distant and deep-seated organs, and these would escape the detection of an ordinary observer, or, indeed, of any one excepting a thorough and accomplished veterinarian, and the subjects of such deposits would be preserved for months or years to spread the disease; 2d. That to extirpate the disease when it has broken out in a stud or locality, it is not enough to dispose of the infected beasts and to thoroughly cleanse and disinfect the premises and movable objects, but this must be followed when requisite by an improvement of the hygienic conditions of the stud, and especially in the matters of ventilation, work, and alimentation. In the case of a disease like glanders, so fatal to both man and horse, the infected horse should be slaughtered as would a venomous reptile, without any consideration of indemnity. The laws under which the destruction is effected should, if possible, be State and municipal, so as to make their administration the especial duty of the local magistrates, but it should be made incumbent on all good citizens to notify such authorities in all suspicious cases, and in case of uncertainty as to the true nature of the disease or indisposition to administer the law, the National Board of Health should be the court of appeal empowered to institute an examination and to see that the law is enforced.

CANINE MADNESS, RABIES, HYDROPHOBIA.

In canine madness we confront a disease which even more than glanders demands restrictive measures. The glandered horse is dangerous mainly to those who voluntarily approach him, and he shows no mischievous propensity to inoculate other animals or man with his dreadful infection. But the rabid dog seems as if the impersonation of all evil. Himself suffering from one of the most excruciating and hopeless of diseases, he seeks to fasten his venomous fangs in the flesh of every living creature, as if he took a malignant pleasure in inflicting his own agonies on all within his reach. Nor is this peculiarity confined to the rabid dog. All animals that naturally use their teeth as weapons of offense when attacked by the violent type of rabies are seized with a similar uncontrollable desire to bite; and as the saliva of the sick is alike virulent in all genera, the danger of the propagation of the malady in this way is very great. The losses from rabies among men and farm animals run far higher than is generally supposed, and are confined to no season, the popular prejudice against the *dog-days* to the contrary notwithstanding. In seeking to reduce these or obviate them altogether much is to be done in the way of—first, regulating the keeping of dogs; second, in advice for the private management of dogs by their owners; third, in protection against the free importation of dogs from countries in which rabies abounds; fourth, in acquainting the general public as to the early symptoms of rabies; fifth, in the destruction of all rabid dogs and of all exposed animals that naturally use their teeth as weapons of offense; and, sixth, in the supervision and frequent examination of exposed animals of genera that do not use the teeth, for a sufficient length of time to insure that no form of the disease, either of a violent or occult type, shall be developed. The destruction of the rabid animal may safely be left to people in the locality, but further precautions would demand the interference of a board of health; hence all cases of rabies should be reported to it, that suitable protective measures may be taken.

MALIGNANT ANTHRAX IN ALL DOMESTIC ANIMALS, AND MALIGNANT PUSTULE AND INTESTINAL ANTHRAX (MYCOSIS) IN MAN.

In all the protean forms of malignant anthrax in animals, we find an infecting material which is not only deadly to quadrupeds, birds, and even reptiles and fishes, but which may be successfully inoculated from any one of these upon the human subject. The malady when conveyed to the human being is a very deadly one, whether it shows itself on the surface in the form of malignant pustule (Siberian boil plague), or internally, as *carbuncular sore throat* or *intestinal anthrax*. In this country it prevails mostly among butchers, tanners, and workers in hair, but is also well known as the result of consuming the flesh of infected animals. Infection from simple contact is by no means uncommon. Quite recently I saw an outbreak in which 100 cattle and three men suffered. In a second, 12 cattle and 2 men. In a third, a cat conveyed the malady to a young lady who nursed it. Where the disease becomes widespread, the resulting human mortality may be excessive, as when in 1770, 15,000 men died in six weeks, in San Domingo, from eating the diseased beef. Cooking is a very insufficient protection, as the resting spores have been shown to survive a boiling temperature, and, in particular cases, even 300 Fah., and a whole family were poisoned in Aberdeen, Scotland, by the beef that had been boiled for hours in broth. Further, and contrary to what holds with most other forms of virus, it is not essential that the skin should be broken in order to its absorption, and numerous instances can be adduced in which fatal results followed when it was deposited on the sound skin. Frost has no influence on its potency, and I have known a number of animals fatally infected by licking the frozen blood from a stoneboat, when the temperature was below zero. Nor is time nor putrefaction to be relied on. I have known cattle to perish promptly after lapping the liquids that leached from a grave in which an infected carcass had been buried nearly a year before. I have further known pastures, on which the disease had been developed for the first time in the memory of the inhabitants, maintain their infecting qualities for six years in succession, and to yield hay which continued to infect animals when fed to them at a distance from such pastures.

Being enthetic rather than infectious, this malady fortunately rarely attains to the dimensions of a plague, and rarely extends very widely from its true sources of origin. These are mostly in damp lands with a soil rich in decomposing organic matters, and especially such as have an impervious subsoil, or which, by reason of the basin-like conformation of the locality, has no sufficient drainage. Rich river-bottoms and drying-up marshes, ponds, and lakes, lands that have been overmanured; and those supplied by drinking-water collected from the surface or from strata rich in organic remains, are especially likely to be centers for the reception and preservation of this poison. In such localities, those animals are especially liable to contract the disease which are already in a somewhat morbid condition, excessively plethoric, having the blood charged with hurtful elements, the result of disease, faulty diet, or imperfect elimination, that have had secretions retained or fever developed in connection with hot dry seasons, lack of water, gastric and intestinal impactions, hot close buildings, insolation or excessive alternations of midday heat or midnight cold, and finally those in which from rapid growth or assimilation the tissues are soft, lax, and watery. With such animals, and in such localities, the disease is very liable to appear, and to continue to appear with increasing frequency and fatality, so that such places come to be known as "*dead lots*," and are avoided by all judicious stock-owners. The malady is always confined to limited districts, unless where the above-named conditions extend over a wide territory, as in the rich alluvial steppes of Eastern Europe and Asia, in the plains of India, and in certain of our

own rich river-bottoms and prairies. It deserves to be stated that, like malarious fevers in man, this affection has become increasingly frequent throughout most of the United States in the past few years. While there is a strong probability that the disease is due to a microphyte—bacillus anthracis—which is found in the blood in all the worst cases, and that certain conditions of the animal system are necessary to cause it to branch out into its special pathogenic development; yet, when its virulence has once been acquired it maintains this through an indefinite number of generations of the virus, and proves one of the most indestructible of known contagia.

Like glanders and rabies, therefore, this disease will demand a careful control by a National Board of Health, and measures must be resorted to for limiting its area and extirpating it wherever it threatens to attain to a dangerous prevalence.

TUBERCULOSIS IN ANIMALS AND MAN.

It is only since the inoculation experiments of Villemin that the dangers resulting from tuberculous animals have been at all appreciated. To-day after ten years of experimental observations by Villemin, Viscar, Klebs, Zurn, Bollinger, Leisering, Chauveau, Bagg, Semmer, Guenther, Harms, Billi, Virgad, Gerlach, Buhl, Tilbury Fox, Burden Sanderson, and a host of others, it has been definitely established: 1st, that tuberculosis can be transmitted from animal to animal, from man to animals, and presumably from animals to man, by inoculation, or by the accidental contact of tuberculous matter with a raw or abraded surface; 2d, that raw tuberculous matter taken from man and animals and eaten by other animals may determine tuberculosis in the latter; 3d, that even the flesh of tuberculous animals will sometimes produce tuberculosis in animals that consume it, though with less certainty than if the tubercle itself were taken; 4th, that the milk of tuberculous animals will at times produce tuberculosis in susceptible subjects, and above all where the morbid deposit has taken place in the udder; 5th, that cooking of the tuberculous matter gives no guarantee of protection, as flesh is a poor conductor of heat, and tubercle that had been boiled from a quarter to half an hour has readily infected a number of animals that partook of it; 6th, that tuberculous matter mixed with water and thrown into the air from an atomizer causes with great regularity the development of tubercles in the lungs of animals respiring such air. The above conclusions will admit of some qualifications. It may be admitted, for example, that the consumption of the flesh and milk of tuberculous animals is often followed by no perceptible injury. Phthisical cows are often eaten without causing obvious disease in the consumers. I have known large dairies of tuberculous cows, in the hands of vigorous and healthy-looking owners, who consumed the milk freely. I have kept two rabbits consuming *all* the milk of a tuberculous cow for months, and until the latter died, without developing any signs of tuberculosis in the rabbits. I have kept other rabbits for two months on the milk of a cow suffering from acute tuberculosis without any appreciable evil result. It may be freely concluded that a large number of individuals while in the enjoyment of robust health will withstand the influence of tubercle taken in by the stomach, but it must be otherwise with the weak and young, those with poor feeding and worse air, those living in damp sunless localities, and subjected to much exposure. In a case that recently came under my notice in Brooklyn, N. Y., a family cow was found in an advanced state of tuberculosis, and the owner (William Martin) and his wife were evidently rapidly sinking under the same malady. In another case reported to me by Dr. Corlies, of New Jersey, a family cow supposed to be suffering from the lung plague was found to be afflicted with tuberculosis instead, and the owner's wife (a consumptive), who had been making free use of the milk warm from the cow, was persuaded to give it up, and underwent an immediate and decided improvement. It is for infants and adults who are somewhat infirm or out of health, or whose surroundings are not of the most salubrious kind, that the danger is greatest, but this embraces such an extended class that the moral interests involved are almost illimitable. The destruction of infancy and wasting of manhood from this cause is unquestionably far greater than has been heretofore realized; and on the moral ground alone this subject demands the watchful attention of a board of health. But even as a financial question, and as estimated by the losses in live stock alone, the subject attains to wide proportions. The infection of tubercle once introduced will often extend from the single diseased animal to a whole herd with startling rapidity. Last winter I visited a herd of sixty Devon cattle that were reported as perfectly sound six years ago. At that time a bull was bought which proved tuberculous, and the disease had steadily increased until at the time of my visit there was not a sound animal on the premises. Into a second herd nine poor calves were introduced in the fall of 1878. They were afflicted with a cough, which soon attacked the five other calves on the place, the eight cows, and two cows of a neighbor that pastured with them. At the time of my visit in the spring of 1879 all showed distinct symptoms of tuberculosis.

These may be thought to be extreme cases, but I am acquainted with districts in which 30 per cent. of the cattle suffer from tuberculosis, and with many high-priced herds in which this scourge yearly claims its victims. In his experiments Professor Gerlach had to utterly discard certain strains of high-bred swine, because of the astonishing frequency of tuberculosis in these subjects.

This disease opens up an extensive field for sanitary work, and particularly in the neighborhood of large cities, where so many infants, subjected to all the depressing influences of city life, are sustained by the milk of cows kept in unwholesome stables and fed so as to secure the greatest possible yield of milk, irrespective of results. Here the environment of the cows that yield the milk and that of the children who consume it are altogether favorable to the propagation of tubercle, and the subject requires the most careful supervision of the sanitary authorities.

The great mass of the adult city population is only a degree better in this respect than the infants; and as the cattle that are no longer useful for milk are too often made into beef, or rather sausages, the children of a larger growth are confronted with the risk of tuberculous meat as well as infected milk. The same dangers attend on the country districts, and though they are to some extent counteracted by pure air and better surroundings, yet the taint, if once introduced into a herd, tends to undergo a steady increase, until, as in the case of the country herds I have referred to above, all fall under its baleful influence. Then, again, in most of our large cities the cows are not kept over one season, but are constantly being replaced by fresh ones from the country; and it is only by purifying the source of the trade that we can secure sound cows in the cities.

That a supervision and restriction of tuberculosis is demanded cannot for a moment be gainsaid; but in view of the enormous proportions of such a work and the great monetary interests involved, together with the recent data of all exact observations on the transmissibility of the contagion and the different results obtained in different cases, it would be well, before proceeding far in this matter, to conduct a series of experiments which would tend to determine more accurately the conditions in which the different products are virulent and the circumstances in which exposed animals are susceptible. The proper supervision of this affection will demand the most careful consideration of the soundest and most enlightened minds. It would demand—first, the enforcement of a series of sanitary rules for the construction and management of city and suburban cow-stables, embracing the sites, exposure, drainage, space per animal, ventilation, water supply, food, cleanliness, &c.; second, a professional inspection of the cow-stables to insure that no cow with active tuberculosis is kept for the supply of milk, and no bull for the propagation of his kind; third, a professional inspection of the slaughter-houses and poulterers' to see that no flesh nor other products from dangerously tuberculous animals are allowed to pass into consumption as human food. As far as possible a sanitary control should be established over country herds as well, and means should be taken to extirpate the disease and remove its causes in the many districts in which the affection has become domiciled as an enzootic.

MALIGNANT (ASIATIC) CHOLERA.

With the threatened approach of a new visitation of cholera the National Board of Health must apply to the lower animals all those precautions which have proved beneficial in warding off this scourge from the human race. In this connection it need only be stated that Annesley, Jamieson, and many other Indian physicians testify that during cholera epidemics the domestic quadrupeds often showed a greater mortality than man, and that poultry-yards were utterly depopulated by the scourge; that Hildebrandt, Hering, Dick, Reynal, and others record the ravages of this plague simultaneously in man and animals in Europe; and that Burden Sanderson and others have produced the disease experimentally in the rodents by feeding paper dipped in the virulent alvine discharges of men. It has often been noticed that birds disappeared during cholera epidemics, the rational explanation being that they perish. This will especially demand the careful seclusion of all animals in cholera districts; the destruction, if necessary, of wild animals; the disinfection of all bowel dejections and of the carcasses of animals dying of the plague, as well as of the places and loose objects where the sick have been; and, lastly, the most careful attention to prevent further infection through fodder, litter, or other solids, and through surface or underground drainage, natural or artificial, into wells or streams, into contact with the food of men or animals or the places where animals resort to lick the soil. It is evident that no system of protection can be effective that fails to recognize that the lower animals transmit this virus as well as suffer its consequences.

MILK SICKNESS. THE TREMBLES.

The great importance of this disease has failed to be recognized, mainly because its source is to be found in certain backwoods districts rarely penetrated by those who preside over our medical literature, and because it gradually recedes before the advance of improved agriculture. Many medical men indeed express grave doubts as to its very existence. Yet the history of the malady is so circumstantial and clear that a doubt as to its specific nature is eminently disingenuous. In its source in unimproved marshy localities it closely resembles the malignant anthrax, also in its communicability to all animals, but it differs essentially in that it fails to show local anthrax lesions, in place of which it expends its energy on the nerve centers, producing great hebetude and loss of muscular power. According to Dr. Phillips, it is characterized by the presence in the blood of a microzym (spirillum), like that seen in relapsing fever. The germ is probably derived from the drinking-water or the surfaces of

vegetables, as certain wells are found to infect with certainty, and the disease has been repeatedly produced by feeding upon particular plants (Rhus toxicodendron, &c). That these plants in themselves are not the pathogenic elements, is shown by their innocuous properties when grown in places out of the region of the milk-sickness infection. It seems altogether probable that here, as in malignant anthrax, we are dealing with a microzym which has developed pathogenic properties and which can be reproduced indefinitely in the bodies of living animals. The great danger of this affection consists in the conveyance of the germ with unimpaired potency through the flesh and milk and through the manufactured products of the latter—butter and cheese. Some even hold that in animals giving milk the system does not suffer materially, but that it is saved by the drainage of the germs through the mammary glands, and that thus a milk-sick cow may remain for a considerable time unsuspected, while her milk, butter, and cheese are conveying mental and physical decay and death to many human beings, near and remote. For the disorder proves as fatal in man as in animals, and if in particular cases it fails to destroy life, it usually leaves the subject in a condition of lebetude and physical weakness that makes life miserable.

The permanence of the germ in butter and cheese renders inevitable the conclusion of physicians in milk-sick districts, that cases of this disease must be frequent in city populations, but that its true nature is not recognized by the medical attendants. The whole subject demands a thorough experimental investigation at the hands of the National Board of Health, so that the true source and germ of the malady may be discovered, if possible, and that in any case intelligent measures may be taken to prevent its conveyance out of its native habitat.

SMALL-POX IN BIRDS.

In Europe and Hindostan variola is so common in pigeons and poultry as to constitute a veritable plague. Thus Guerseut records that out of a dovecote of 1,000 scarce 100 could be found that did not bear marks of the disease, while Tytler says the poultry-yards in India were habitually depopulated by the plague. Bechstein and others claim that this is the true small-pox derived from the human being and conveyable back to man, while others, like Toggia and Gilbert, assert that it is communicable to the sheep. That this affection has not been recognized among us may be due to a difference in the environment which modifies the infection, or, perhaps, to the fact that men and pigeons do not live so much in common here as in Italy and India. Such an occurrence under Italian skies should, however, demand a careful investigation into the reality of such infection in our own States, and especially the Southern ones, during the prevalence of an epidemic of small-pox, so that whatever danger arises from this source may be detected and guarded against.

ECZEMATOUS (APHTHOUS) FEVER IN ANIMALS.

Although this disease is communicable to man in a mild form, and to infants who live on the fresh milk in the form of a violent and even fatal inflammation, yet, as it has at present no foothold on this continent, and, like rinderpest, sheep-pox, dourine, quebia bunda, &c., may be easily excluded by inspection and quarantine at our ports, it will be best to leave it with the purely animal plagues to the control of a veterinary sanitary bureau, and thus avoid the multiplying of inspectors.

TYPHOID FEVER IN SUCKING CALVES.

Reports have lately been published of the occurrence of this disease in calves, and of the infection of a number of persons that have eaten of the veal; it seems very desirable, therefore, that experiments should be instituted to ascertain whether animals kept on an exclusively milk diet are susceptible to this infection of man. It seems altogether probable that a mistake has been made and that the calves and their victims died of trichiniasis, intestinal anthrax, or of some other poison common to man and animals; but it should at least be shown by the National Health Board that the danger of the alleged transmission of typhoid fever is altogether fanciful.

TRICHINIASIS.

The life-history of the trichina spiralis is now fairly understood. The parasite is harbored by very many mammalia and probably even by reptiles, but is, above all, common in rats, pigs, and men. It has its two principal stages of existence—the *sexually mature* form, which lives and propagates its kind in the intestines only, and the *immature asexual* form, which, born in the intestines, bores its way through their walls and into the voluntary muscles, where it encysts itself. These last attain maturity only when their host is devoured by a carnivorous animal, and when the cyst is digested off so as to set the imprisoned trichina free. A third habitat may be named for those embryos that have been carried out of the system by the prevailing diarrhea ere they have had time to penetrate the intestinal walls and seek an asylum in the solid tissues. These can live for an indefinite length of time in pools of water without undergoing further development, until they are taken in by a mammalian host, when they penetrate the intestinal walls and encyst themselves in the muscles.

All this has been known for many years, but sanitation has advanced no further than to advise the microscopical examination of all pork, to enjoin that it be thoroughly smoked or well cooked before it is eaten, and to utter a warning against keeping pigs about slaughter-houses and feeding them on the raw waste products. Meanwhile, our pork hams have been, rightly or wrongly, acquiring a most undesirable reputation. Dr. Belfield and Mr. Atwood, of Chicago, pronounce 5 per cent. of the hogs killed in that city to be trichinous, and several European countries have forbidden the importation of American hams. In Germany, on the other hand, where all pork is subjected to microscopic examination, the statistics show that trichina have been found in but one of 2,000 hogs examined.

The protection of our population against this tremendous scourge, and of our market against the embargoes of frightened Europeans, demands a system which shall reach further and prove more thorough. The feeding of pigs on any flesh that is not thoroughly cooked should be strictly prohibited, a trichina inspector should be made to examine all pork exposed for sale, in our cities especially, and any discovery of trichinous pork, whether from such inspections or from the occurrence of the disease in man, should lead to such inquiries as would in all possible cases discover the source of such pork, and then should follow the destruction and prolonged boiling of all hogs, dogs, cats, rats, mice, snakes, and other carnivorous animals on the premises, the burning of the hog-pens and manure and the closure of the yards against hogs for one year; also, the shutting up of all wells or other collections of water to which the swine may have had access or into which drainage from the pens could have taken place.

Further, examination should be made in such localities of all animals, vertebrate and invertebrate, that the hogs could be expected to have devoured. Under such a system not only may we hope for a material decrease of trichinous hams and bacon, but for valuable discoveries of hitherto unsuspected and dangerous hosts of parasites, so that the work of extermination would continually become more easy and effectual.

ECHINOCOCCUS.

In all countries where it abounds (Iceland) this is one of the most destructive of the parasites of man. In the United States it is by no means so common as to give rise to much apprehension, and yet an examination of the internal organs of animals slaughtered, and a consultation of medical records, show that it is far from uncommon. As the parasite is derived from the dog, and as its tænia form in the bowels of that animal is so small as to be rarely recognized, it is likely to cause great damage before its presence is suspected in a locality. This is but one of a myriad of heavy charges that must be brought against the crowds of useless curs that everywhere abound, and more or less directly impair the health and prosperity of the people. With man alone the dog reciprocates in sustaining no less than seven dangerous animal parasites, in addition to the vegetable ones, producing the different forms of ringworm; with cattle and sheep he joins in maintaining three that devastate our herds and flocks. His ubiquity is a continual threat of canine madness to all living things. He has remanded to nature, or to less productive culture, large tracts that are admirably adapted to the raising of sheep, but where the losses from the devouring jaws of the dog have rendered sheep farming unprofitable. Sanitary considerations, alike affecting man and beast, therefore demand a rigid control of dogs and the imposition of a tax that shall be to a large extent prohibitory of their maintenance. Further, whenever echinococcus, cysticercus tennicollis, Bothriocephalus latus, B. cordatus, Strongylus gigas, Pentastoma tænioides, or Demodex follicilorum occur in man, attention should be given to the condition of the dogs in the locality, and measures taken to prevent the propagation of these parasites through their systems.

OTHER PARASITES.

To go over the other parasites which are common to man and animals would serve no good purpose. They rarely attain to the gravity of an epidemic, and will only demand sanitary interference in very exceptional circumstances; yet the board of health must be so constituted that it can effectually deal with any of these in such an emergency. For this, a veterinary sanitary committee will be always prepared, and will act mainly as an advisory body; but also, when necessary, in an executive capacity. Thus, an influx of measly pork should demand that it be traced to its source, and that its source, the tapeworm of man (T. solium), should be destroyed, while all pigs should be forbidden the infected ground for over a year. An influx of measly veal should demand a similar correction, and thus dangers of a material increase of either of these parasites will be done away with. In fishing localities where the Bothriocephalus latus or B. cordatus gains a wide diffusion it may become necessary to keep all dogs under the closest surveillance and to periodically rid them of the parasite. It might further become needful to control the consumption of certain fish, or of fish-eating mammals likely to be devoured by dogs. The prevalence of Sarcoptis mutans (scabies) in chickens may become so great that it will entail a most inveterate itch in man, the true source of which is seldom discovered. Again, gregarina have lately been found in the lungs of chickens, and in the bowels of pigs, and it seems quite within the bounds of probability that as they live on the hairs of man, so they may at times infest his internal organs.

For the above reasons it is desirable that Congress should provide or the incorporation with the National Board of Health of one or more veterinarians, whose functions it would be to consult with the present members in all matters in which the health of the lower animals affects that of man; to advise as to the enactment and administration of State laws for the prevention and extinction of plagues and parasites common to man and animals; to conduct experimental researches into the source, propagation, and extinction of these disorders and parasites of animals, and to act when necessary in an executive capacity in the exclusion or control of these scourges. To carry out these objects Congress should be asked to appropriate a sum of money, to be expended, as may be seen to be best, in experiments, in investigations, and in the control of these epidemics and epizootics.

Plagues and parasites peculiar to the lower animals.

In turning now to the communicable disorders of the lower animals to which man shows no susceptibility, we face a much more extended class. No less than thirteen different forms of contagia and thirty-four different parasites exist, any of which may induce a prevalence that rises to the dignity of a plague. Among the contagia given in our list the majority are probably indigenous to our soil, while four are certainly exotic. Of the latter but one (lung plague of cattle) is known to exist at present in the United States, but that one more imperatively demands instant and effective action than all our plagues of home birth. Arising in this country from contagion only and having an excessive incubation period (one to three months), it can be spread with the greatest facility by animals that carry the seeds of the malady but have not yet developed the disease. Having a constant tendency to the death of tissue and to the encystment of this as a mass (infecting material), which remains unchanged for many months in the chests of animals that are thought to have recovered, it is ever liable to be spread by the apparently convalescent. Add to this that this contagion, if once carried to our Western and Southern stock-ranges, could never be eradicated, but must remain as a permanent incubus and scourge as it has on the Steppes of Russia, the open lands of Australia, and the unfenced ranges of Southern Africa, and we see reason why a prompt attention should be given to its speedy extermination. If more is wanted to enforce this, it is the calculation (based on the European losses from this plague and the steady increase of our own herds of cattle) that this pestilence, left to itself and extended to our Western stock-ranges, will probably lay us under a tax of $130,000,000 per annum. But the flesh of animals attacked with this plague has never been shown to be injurious to man, and thus the question of its extinction is an exclusively pecuniary one and demands the action of the stock-owner rather than the sanitarian. While the necessary steps to insure the extinction of this and allied plagues are sufficiently well known to the veterinary profession, and while effectiveness and promptitude are best secured by placing the matter in the hands of one executive head, yet it will better command the confidence of the stock-owners and indirectly of Congress if one or two representative stockmen are officially connected with the work.

While on purely professional matters the veterinarian must of course decide, and in the execution of the work which is essentially professional he should direct, yet in many subjects connected with cattle-raising and the peculiarities of the trade in different parts of the country the knowledge and experience of the stockman will be of inestimable advantage in arriving at safe and effective local enactments that will not unnecessarily harass or hamper trade on the one hand nor be easily evaded on the other. A small committee or bureau of this kind, clothed with executive authority and with financial means equivalent to the end, could make much more effective work than could a committee of the Board of Health, who could not be got together to meet every emergency. Again, the first part of this sanitary work must be done as speedily as possible because of the great and increasing dangers that attend upon delay, and to secure this it will be necessary to appropriate a large sum of money to enable the executive to carry it on with uninterrupted energy to the end, since any suspension for lack of funds would entail the renewed spread of the disease and the loss of all that had been already expended. This consideration is a vital one, and of itself would decide me in favor of a separate executive, for the exclusively animal plagues, to be furnished with abundant means and full administrative power. A supplementary appropriation to the Board of Health, which might be largely used up for what at the moment and as viewed from a moral standpoint might appear as a more urgent demand, would be hurtful to both human and veterinary sanitation. If, for example, the work of exterminating the cattle lung plague had to be entirely arrested for want of means, it would soon again extend over the ground which it had lost, all that had been expended on it would be forfeited, and there would be much less likelihood of a speedy resumption of the work. If even the work were only retarded for lack of means, as has been the case in New York for the past three months, if the executive could only quarantine infected herds and partially control the movement of cattle, but could not kill the sick for want of means to indemnify the owners for their losses, a most hurtful blow would be dealt to the entire system of national sanitary legislation and administration. In either case the most prominent fact before Congress and the people would be that so many hundred thousand dollars had been expended for the extinction of a plague which, when the next appropriation was requested, either prevailed as widely as at first or was only appreciably less prevalent. All representations that the want of success had been due to the lack of means would receive little attention; the community would conclude it better to squander no more money on the matter; all further veterinary sanitary legislation would probably be rendered hopeless; no small amount of opprobrium would be thrown on the National Board of Health itself, and a severe blow would be dealt to all national health legislation.

It is especially fortunate that, by reason of the active measures carried out in the first six months of our work in New York, we can now point to seven counties virtually cleared of the pestilence, and by later restricting our work to controlling movement of cattle, we have been able to prevent any renewed extension of the pest; yet with a little more means New York might have been to-day all but clear of this scourge.

The time may come when the nation will be sufficiently educated to allow the sanitation of man and animals to be controlled by a single National Health Board; but at present, and for the exclusively animal plagues, we cannot afford to run any risks, and that method should be followed which will secure a certain and speedy result, and establish the principle of the extinction of such pestilences on a sound and unassailable basis. I would therefore urge as the result of mature deliberation, in view of all aspects of the question, that the control of those animal contagia and parasites which affect man as well should be placed in the hands of a veterinary committee of the National Board of Health organized for this purpose, while the exclusively animal plagues and the parasites that affect animals only should be committed to an organization drawn from the stock-owners and the veterinary profession, and not too large or unwieldy for the most prompt and effective action.

I consider it needless to encumber this statement by any further reference to the other animal plagues and parasites, as I would not recommend *immediate* executive action for more than one other in addition to the bovine lung-plague. Besides this, the work of the special veterinary organization would consist mainly in controlling the imports of live stock and in advising as to the management of local epizootics which did not immediately threaten the nation at large.

The following circular has been issued by the State board of health of Tennessee, relating to commerce with New Orleans:

OFFICE OF STATE BOARD OF HEALTH,
Nashville, Tenn., July 14, 1880.

Whereas one death from yellow fever, and two other cases, have occurred in New Orleans among the crew of the coffee-ship *Excelsior*, from Rio de Janeiro; and

Whereas the history of said ship, as recited at a meeting of the Louisiana State Board of Health, held in the city of New Orleans on the 12th instant, conclusively shows that the vessel and her cargo are infected with yellow fever; that her infected cargo is now stored in a warehouse in that city; and that her captain, some members of her crew, and a large number of visitors, as well as the persons (seventy-five or more) who were engaged in and about said infected vessel in breaking out cargo, and in handling, draying, and storing her infected merchandise, are scattered throughout said city; and

Whereas this board is charged with the duty of protecting the public health of this commonwealth against the introduction of contagious and infectious diseases, and believes such introduction is now seriously threatened by the above described condition of affairs at New Orleans, it is therefore hereby ordered—

First. That on and after the date of this publication no freight-car over any railroad, nor any steamboat or other water craft departing from the city of New Orleans after the 15th day of July, 1880, and until further orders, shall be allowed to enter the State of Tennessee nor to make a landing upon the borders of the State for the purpose of transacting any business whatsoever, unless said car, boat, or water craft shall present to the proper officers of this board a certificate from an officer or agent of the National Board of Health to the following effect:

(*a.*) That said officer or agent of the National Board of Health has personally examined the freight of such car, or the cargo, passengers, officers and crew of such steamboat or water craft, and has satisfied himself of the freedom from infection of said vehicle and its contents (persons and things).

(*b.*) That the freight or cargo comprises none of the following articles of the list recommended by the Louisiana State board of health to be subjected to obligatory quarantine and purification, to wit: Clothing, personal baggage; and dunnage, rags, paper stock, hides, skins, feathers, hair, and all other remains of animals; cotton, hemp, woolens, and coffee; nor any of the following additional articles, which are hereby declared contraband of quarantine in this State, to wit: Second-hand bedding, clothing, upholstered furniture, and textile fabrics; moss, jute, and "excelsior"; tropical fruits and productions.

Second. That any of the articles above enumerated may be shipped as freight from New Orleans, and transported through the

State of Tennessee by rail, if carried in close box-cars, securely locked, and in charge of an officer or agent of this board. The expenses of such officer or agent shall be defrayed by the railroad transporting such goods.

Third. That this order shall be enforced on the railroads at the southern State line by the officers of the board appointed for such purpose; and at Memphis, and elsewhere upon the Mississippi River, by the wharf-master, or other duly authorized officer. The penalties prescribed by law for the violation or infraction of the orders of this board will be rigidly enforced in carrying out this order.

Members.

The following circular, relating to the same subject as the preceding, has been issued by the State board of health of Mississippi:

OFFICE OF MISSISSIPPI STATE BOARD OF HEALTH,
Jackson, Miss., July 16, 1880.

Whereas the bark Excelsior, from Rio de Janeiro, laden with coffee, having arrived at New Orleans infected with yellow-fever; and

Whereas her cargo is now stored in a warehouse in the latter city, and it is said a number of persons who were engaged on and about said bark in unloading, draying, and storing her cargo are now in said city, it is therefore hereby ordered—

First. That on and after this date, and until further orders, no car or train of cars departing from the city of New Orleans shall be allowed to enter this State, and no steamboat or other water-craft from said city shall be allowed to land at any point in this State unless they have undergone an inspection by an officer of the National Board of Health, as is provided in the rules of said Board, and are provided with a certificate of such inspection.

Second. That no part of the cargo of the bark Excelsior, and no freight from the warehouse in which said cargo is stored, shall be brought to any point in this State.

Third. That no persons from New Orleans shall be allowed to come to any point in this State unless they hold a certificate from an officer of the National Board of Health that they have not been exposed to infection.

Fourth. That the chief health officers of the counties, and the municipal Boards of Health are charged with the enforcement of this order, and any violation thereof will be punished as is provided by law.

WIRT JOHNSTON, M. D.,
ROBERT KELLY, M. D.,
Executive Committee.

Approved.
J. M. STONE,
Governor.

INSPECTION OF STEAMBOATS AND OTHER WATER CRAFTS AT SHREVEPORT, LA.

AN ORDINANCE relating to the inspection of steamboats, barges, and other water-crafts coming from any points on the Mississippi River where yellow fever or other infectious diseases may exist, and the establishment of a quarantine station below the city.

SECTION 1. *Be it ordained by the council of the city of Shreveport in legal assembly convened*, That during the months in which the inspection station of the National Board of Health at or near the mouth of Red River is in operation, no steamboat, barge, or water-craft coming from any port south of the mouth of Red River, or from any other point on the Mississippi River, or its tributaries, where yellow fever or other infectious diseases are known to exist, shall be allowed to enter or land at this port without a clean bill of health or certificate issued or countersigned by an inspecting officer at Station No. ——, at or near the mouth of Red River. This certificate must show that the passengers and crew of such water-craft are free from contagious and infectious diseases, and that the baggage of passengers and crew, and the freight, furniture, and outfit of vessel are free from infection likely to engender such diseases.

SEC. 2. *Be it further ordained, &c.*, That whenever, in the opinion of the board of health of Shreveport, La., the public safety demands it, there shall be created a second inspection station in the vicinity of the city at such point as the board of health may designate. At this station all steamboats, barges, or other water-crafts shall be detained for inspection by the health officer of Shreveport, who shall issue to such vessels a certificate before they shall be permitted to moor at this port.

SEC. 3. *Be it further ordained, &c.*, That any captain, owner, employé, or other officers or persons in charge of such water-craft, who shall violate any part of this ordinance, shall be arrested, and, upon conviction before any court of competent jurisdiction, be fined not less than twenty-five nor more than one hundred dollars for each and every offense; and such boat or water-craft, upon landing or entering at this port, in violation of any part of this ordinance, shall at once be removed beyond the limits of the port.

Adopted.

A. CURRIE, *Mayor.*
W. J. BRUNER, *Comptroller.*

HEALTH CIRCULAR, HAVANA, CUBA.

The following circular evidently leaves it optional with masters of vessels bound to the United States to take out bills of health or not:

In consequence of doubts having arisen with port physicians in regard to whether it is or is not obligatory upon all vessels leaving the island to take bills of health, his excellency the governor-general, in conformity with the suggestions of the superior board, has been pleased to order that national as well as foreign vessels are free to take out or not the said bills of health, except when bound to Spanish ports, in which case they shall provide themselves with the document referred to; which, by order of his excellency, I communicate to your excellency for your information and compliance, and you will please order the publication of the resolution in the official bulletin of that province under your worthy command, for general information.

God preserve you many years.

Havana, June 18, 1880.

The secretary of the general government:

JOAQUIN CARBONELL.

To the civil governor of the province of —— ——.

YELLOW-FEVER CASE AT NEW ORLEANS.

On Saturday, the 10th of July, 1880, at 10 a. m., James Kenney, aged 19 years, a native of Scotland, was admitted to the Touro Infirmary, from the Swedish bark Excelsior, presenting symptoms of yellow fever.

The bark Excelsior was then lying at the foot of Calliope street, post 13, first district. This vessel, 150 tons, S. L. Byorkgren, master, sailed from London 17th February, 1880, and arrived at Rio de Janeiro April 13, 1880; left Rio on the 10th May and arrived at Mississippi quarantine station June 24, having been on the voyage about 46 days. The crew consisted of three officers and nine seamen. No case of sickness occurred in Rio or on the voyage to the Mississippi quarantine station. The vessel was detained at the quarantine station 12 days. The cargo consisted of 3,600 sacks of coffee; ballast, granite rock. She left the quarantine and arrived at New Orleans on the morning of the 5th July and commenced discharging cargo, which was deposited in the Montgomery Warehouse, on Fulton between Julia and Saint Joseph streets.

The case of yellow fever was not developed until the vessel had been for 62 hours at the wharf at New Orleans.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BUFFALO, N. Y., July 12.—Dr. A. H. Briggs, health physician, forwards a copy of a circular, addressed to employers, to obtain through them a record of absence of employees on account of sickness. The record is to be kept, on a form furnished by the board of health, in all establishments employing not less than 20 persons, to begin July 15, and to end September 15. The object is to determine the influence of the Hamburg Canal upon the health of persons employed in its immediate vicinity.

BURLINGTON, VT.—Under date of July 10, Dr. G. M. Ockford observes that the past month had been generally healthy in this city. In June there was very little sickness of any sort, but the heat of July produced an increase in diarrheal diseases; no epidemic tendency is observed.

FORT RINGGOLD, TEX.—Under date of June 30, Surgeon Joseph R. Smith, U. S. A., makes the following report:

As far as I can learn, no new cases of small-pox have occurred in Rio Grande City, Tex., during the month, nor any deaths from this cause.

The cases occurring since my first report have been chiefly among persons visiting the town from surrounding ranches.

The vaccinations and revaccinations reported as being practiced on May 30, 1880, were unsuccessful.

HAVANA, CUBA.—Advices of July 3 report 50 deaths from yellow fever during the week ending that day. Some cases have occurred among the shipping at the wharves, especially on Spanish vessels. All vessels bound to United States ports are fumigated and disinfected on discharging, and in some cases again after loading. No great extension of the fever is to be expected in Havana at present, as there are but few persons liable to have it. Not many foreigners have come in, the army is mostly in the country, and the naval vessels absent.

During the week ending July 10, there were 71 deaths from yellow fever and 11 from small-pox. Of the deaths from fever, 28 were in the city and 43 in the military hospitals. The village of Casa Blanca, on the other side of the bay, near the entrance to the harbor, is suffering greatly from the fever. Epidemic diarrhœa and dysentery have caused many deaths among children and old persons in the city and suburbs.

For the week ending July 10, 1880, out of a total mortality in Havana of 250, there were 76 deaths from yellow fever, 10 deaths from small-pox, 4 deaths from typhoid fever. Prevailing diseases were yellow fever, small-pox, diarrhœa, and dysentery.

For the week ending July 16, 1880, there were 74 deaths from yellow fever, and approximately there were 200 cases of that disease in the city and suburbs.

Advices from Havana to the 17th July state that, "Among all the vessels fumigated, purified, and disinfected, there is yet to be noted a subsequent invasion of yellow fever, and that so far this season all vessels that have been infected by yellow fever have contracted it at the wharves, in none has it occurred in the open bay, and that at the date of writing (July 17, 1880) there were about ten vessels in port which have or have had yellow fever on board.

PENSACOLA, FLA.—S. C. Cobb, president board of health, sending report for the week ending July 3, remarks:

We are pushing our people to constant attention to sanitary matters, with good results. The ships admitted to *pratique* are remarkably clean, and no danger is apprehended.

TUXPAN, MEXICO.—Under date of July 5, Dr. A. M. Boyd gives the following report on the condition of the city:

The health of this port and vicinity has been unusually good during the past month. The total number of deaths from all causes was ten; 3 from malarial fever, 1 from croup, 1 from epilepsy, 1 from consumption, 1 from pneumonia, 1 from colic, and 2 from accidental causes; making the death-rate 16.6 per 1,000 of the population of 7,186. The sanitary condition of the place is excellent. No epidemic or contagious disease of any kind has occurred here for more than two years, and we hope by strict attention to sanitary rules to avert an epidemic this year, so as not to interrupt intercourse with the ports of the United States.

ABSTRACTS FROM CONSULAR REPORTS.

BRADFORD, ENGLAND.—United States Consul C. O. Shepard sends a report of deaths for the week ending June 19. The number of deaths was 77, and the annual rate per 1,000, 20.2. Six deaths were from scarlet fever, said to be of malignant type; only 7 deaths were due to all other zymotic diseases. Other causes were, consumption, 3; other lung diseases, 16; heart diseases, 10; and 4 from violence.

COLOMBO, CEYLON.—United States Consul W. Morcy forwards a copy of the report of the municipal council for the last quarter of 1879. The year had passed without any epidemic disease, and no unusual mortality. The report is chiefly upon the danger of extending the new portion of the city over the "Cinnamon Gardens," a tract in which the *ground water* is so near the surface as to render the construction of healthy foundations and proper privies difficult and expensive. Thorough general draining, by means of sewers leading to the sea, is recommended before building.

RIO DE JANEIRO.—United States Consul Thomas Adamson sends reports for the weeks ending June 12 and 19. There were 30 deaths from yellow fever, and 3 from typhus fever in the two weeks. The total number of deaths was 372, in a population of 330,000, giving an annual death-rate of 29.3 per 1,000. Shipmasters complain bitterly of the regulation that makes bills of health show the vessel as leaving *in quarantine*, so long as any cases of yellow fever exist here. Many refuse to take consular bills of health.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

Fayette, Miss., 300; no deaths. Flint, Mich., 9,000; deaths, 2; under 5 years, 1. Ginn City, Mo., 125; whooping-cough 1, under 5 years. Helena, Mont., 3,500; one death, under 5 years. Huntingdon, Pa., 1,500; no deaths. Huntingdon, Tenn., 850; one death. Indianola, Tex., 900; no deaths. Iuka, Miss., 1,000; pneumonia 1. Jefferson, Tex., 3,250; malarial fever 1. Kenosha, Wis., 5,000; one death. Lansingburg, N. Y., 7,150; deaths, 3; enteric fever 1, pneumonia 1. Lebanon, Pa., 9,000; deaths, 3; consumption 1, malarial fever 1, pneumonia 1. Little Falls, N. Y., 6,900; deaths 2; consumption 1, puerperal 1. Louisiana, Mo., 5,200; no deaths. Madison, Ind., 9,000; deaths, 5; under 5 years, 2; consumption 2. Marquette, Mich., 4,700; deaths, 3; diarrhœa 1, diphtheria 1, whooping-cough 1. Martinsburg, W. Va., 6,350; deaths, 3; under 5 years, 2; diarrhœa 2, enteric fever 1. Milledgeville, Ga., 4,000; deaths, 4; under 5 years, 2; consumption, 1; diarrhœa 1. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,400; diarrhœa 1, under 5 years. Muskegon, Mich., 11,300; deaths, 5; under 5 years, 4; diphtheria 1, scarlet fever 2. Natchez, Miss., 10,000; old age 1. Nebraska City, Nebr., 5,000; diarrhœa 1, under 5 years. Ocala, Fla., 1,000; deaths, 2; puerperal 1. Oshkosh, Wis., 18,000; deaths, 6; under 5 years, 1; consumption 1, diarrhœa 2, lung disease 1. Painesville, Ohio, 5,000; deaths, 3; under 5 years, 1; diarrhœa 1. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,600; diarrhœa 5, under 5 years. Pleasant Hill, Miss., 250; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Jervis, N. Y., 10,000; old age 1. Ripley, Miss., 1,000; one death, under 5 years. Rock Island, Ill.; deaths, 6; no population given. Rockland, Me., 7,500; diarrhœa 1, under 5 years. Springfield, Ohio, 21,000; deaths, 12; consumption 2, diarrhœa 5, old age 1. Starkville, Miss., 1,450; no deaths. Steubenville, Ohio, 13,500; deaths, 8; under 5 years, 5. Tampa, Fla., 1,200; no deaths. Titusville, Pa., 9,000; deaths 4, under 5 years; diarrhœa 2. Winchester, Va., 5,000; deaths, 2; under 5 years, 1; consumption 1, diarrhœa 1. Youngstown, Ohio, 15,500; deaths, 4; under 5 years, 3; diarrhœa 3. Total population, 430,525; deaths under 5 years, 69; total deaths, 165; annual rate per 1,000, 20.3.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JULY 31, 1880. [No. 5.

MONTHLY REVIEW OF MORTALITY FOR MAY, 1880.

The mean population represented in the reports for the month of May shows an increase of 95,605 over that for April; the mean number of deaths per week being 37 more than last month, the annual rate is nearly the same, having changed only from 20.22 to 20.24 per 1,000 for the whole country. But while the death-rate of the white race, as represented in a mean population of 1,467,702, has only risen from 18.2 to 19.9, that of the colored population in the same cities, with a mean of 371,078, has increased from 32.0 to 37.4. Defective hygienic conditions, and want of care in the selection and use of food, have rendered the latter race more liable to the attacks of the diarrhœal and other diseases incidental to the warm weather.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Causes of death.—The high temperature of May, having been remarkably uniform, had the effect of reducing the death-rate from *acute lung diseases* from 3.19 to 2.53 per 1,000, or 20.7 per cent. *Consumption* at the same time fell from 3.06 to 2.80, or 8.5 per cent. *Diphtheria* has remained nearly stationary at 0.61 per 1,000, while *croup* shows a decline from 0.39 to 0.27, or nearly 31 per cent. *Scarlet fever* shows some change for the better, falling from 0.52 to 0.48; and *enteric fever* has declined from 0.35 to 0.29, or more than 17 per cent. *Measles* are still slowly increasing, having risen from 0.42 to 0.46 since April. *Whooping cough* has fallen only from 0.26 to 0.24. *Malarial fevers* have advanced their rate from 0.23 to 0.28 per 1,000. Taking the six zymotic diseases just named, the changes of rate are so nearly balanced that the aggregate mortality from them in May was 2.35 per thousand, as compared with 2.39 in April. *Diarrhœal diseases* were noted last month as beginning to increase their rate of mortality; this increase was gradual until the third week in May, when a sudden rise from 0.66 to 1.00, followed by a leap from 1.00 to 1.74 the next week, shows the full establishment of the annual holocaust, which usually culminates about the middle of July.

Distribution of diseases.—On dividing the country into three sections, as before, the first change observed in comparing this month with the last is the rise of the death-rate in the Southeast section from 21.06 to 24.19 per 1,000, while that of the Northeast declines from 21.82 to 21.48, and of the Northwest from 16.70 to 15.67. It will be readily seen that these changes are due to the increase of diarrhœal and other heat-diseases in the Southeast, and the reduction in pulmonary diseases in the two other sections. The latter class of diseases has declined as follows: Consumption in the Northeast from 3.40 to 3.16, or 7 per cent.; lung diseases from 3.68 to 3.10, or 16 per cent. Consumption in the Northwest from 1.84 to 1.55, or 16 per cent.; lung diseases from 2.74 to 2.04, or 26 per cent. Consumption in the Southeast from 3.74 to 3.61, or less than 4 per cent.; lung diseases from 2.52 to 1.71, or 32 per cent. At the same time the increase in mortality from diarrhœal diseases has been in the Northeast from 0.29 to 0.56, or 48 per cent.; in the Northwest from 0.25 to 0.40, or 59 per cent.; and in the Southeast from 0.77 to 2.79, or 72 per cent. From this comparison it appears that whether the relation of heat to disease be primary or secondary in causation, it is at this season the controlling element in determining the rate of mortality.

Taking the mortality from diarrhœal diseases as an index to the general effect of heat in raising the death-rate, the following comparison may be made between some of the principal cities. The figures express the deaths from diarrhœal diseases in per cent. of the total mortality (omitting fractions) for the week ending May 29: New York, 7; Brooklyn, 5; Baltimore, 23; District of Columbia, 27; Norfolk, 39; Richmond, 28; Atlanta, 47; Augusta, 50; New Orleans, 11; Louisville, 20; Cincinnati, 14; Chicago, 9; and Saint Louis 14. Near the Atlantic seaboard the rate closely follows the latitude, allowance being made in some cases, as in Richmond, Va., for elevation of site, and other topographical advantages. The great river cities, New Orleans, Cincinnati, and Saint Louis show a very low death-rate from heat-diseases, and without relation to latitude, New Orleans giving the lowest rate of the three.

Taking the other zymotic diseases in the order of the table, it is to be observed that diphtheria has increased in the warmer climate of the Southeast section 13 per cent., while it has advanced only 6 per cent. in the Northeast, and has declined 24 per cent. in the Northwest. Croup, on the contrary, has fallen off 48 per cent. in the Southeast, as compared with 31 per cent. in the Northeast and 18 per cent. in the Northwest. Scarlet fever has declined but 5 per cent. in the Northeast and 6 per cent. in the Southeast, while the rate has fallen off 13 per cent. in the Northwest. Enteric fever is now most fatal in the Southeast, where the rate has risen nearly 5 per cent., while it has declined 6 per cent. in the Northeast and 24 per cent. in the Northwest. Measles, having probably exhausted most of the available material in the Northeast, have there declined from 0.46 to 0.44, while the rate has increased in the Northwest more than 24 per cent. and in the Southeast 35 per cent. since April. Whooping-cough continues most fatal in the warmest climate, the rate in the Southeast having advanced from 0.45 to 0.49, or 9 per cent., while in the Northeast it has fallen from 0.20 to 0.18, or 10 per cent., and in the Northwest from 0.26 to 0.22, or 15 per cent. Malarial fevers show a general increase: in the Northeast from 0.20 to 0.26, or 30 per cent.; in the Northwest from 0.18 to 0.22, or 11 per cent.; and in the Southeast from 0.40 to 0.49, or 22 per cent. Small-pox, so far as reported, shows 15 deaths in the Northeast section, of which 9 were in Philadelphia, 3 in Fall River, Mass., 2 in New York, and 1 in Worcester, Mass. In the Northwest section, 4 deaths were reported in Chicago, and the Southeast shows one death, in New Orleans. During this month, active precautionary measures have been taken by the local authorities and State boards of health along the Mississippi River in establishing efficient quarantine and inspection services, with the co-operation of the National Board of Health, in view of the possible introduction of yellow fever from abroad, or the revival of the disease in places infected last year.

AN ORDINANCE RELATING TO THE TREATMENT OF CASES OF CHOLERA, YELLOW FEVER, SCARLET FEVER, SMALL-POX, AND DIPHTHERIA IN THE STATE OF ILLINOIS.

SECTION 1. *Be it ordained by the city council of the city of Jacksonville*, That any physician practicing in said city who shall be called to any sick person laboring under *cholera, yellow fever, small-pox, scarlet fever*, or *diphtheria* shall forthwith report the same to the health warden, in writing, giving the name, age, color, sex, nationality, and describing the street, number, house, or place where such sick person may be located, so that it may be easily found, together with such other facts as may be deemed necessary to a complete statistical record; and for neglecting so to do shall be liable to a fine of not less than ten nor more than fifty dollars for each offense.

SEC. 2. No person shall put out or remove, or allow to be put out or removed, from the premises owned or occupied by him or her into any street, alley, or other public place in said city, any person having *cholera, yellow fever, small pox, scarlet fever*, or *diphtheria*, or allow such sick person to go out into any street, alley, or other public place in said city, until such time after recovery as shall be prescribed by the health warden or attending physician, except as prescribed in section 6th of this ordinance. But such owner or occupant shall, in case no physician be called, immediately report such cases to the health warden; and any person who shall violate any clause of, or neglect to perform any duty required in, this section shall, upon conviction thereof, pay a fine of not less than ten nor more than fifty dollars for each and every offense.

SEC. 3. The health warden shall keep a book, in which he shall record a complete account of all cases of *cholera, yellow fever, small-pox, scarlet fever*, and *diphtheria*, including the name, age, sex, color, nationality, and such other facts attainable as he shall deem necessary to a complete statistical record of such cases occurring in said city.

SEC. 4. It shall be the duty of the health warden to visit and examine, or cause the same to be done by a competent physician, who may be the attending physician, all persons who may be reported to him as, or whom he may have reason to suppose to be, laboring under *cholera, yellow fever, small-pox, scarlet fever*, or *diphtheria*—except that when such report shall be made by a legally practicing physician he shall regard it as conclusive—and upon finding satisfactory evidence of the existence of such disease shall at once report the same to the city marshal.

SEC. 5. It shall be the duty of the city marshal, when notified by the health warden of the existence of *cholera, yellow fever, small-pox, scarlet fever*, or *diphtheria*, to cause a sign of warning to the public to be so placed on said building or premises that it may be seen and read by persons approaching said house or place; and if any person shall tear down, mutilate, destroy, or remove any such warning without the permission of the health warden, such person shall be liable for each offense to a fine of not less than ten nor more than one hundred dollars. The occupant of the house or premises upon which such notice or warning shall be placed shall be responsible for the removal of the same, and if it shall be removed without the permission of the health warden such occupant shall be subject to a like fine of not less than ten nor more than one hundred dollars, unless he shall notify the health warden within twenty-four hours after the removal of said warning.

SEC. 6. It shall be the duty of the health warden, mayor, and marshal of the city of Jacksonville, in case of the occurrence of *cholera, yellow fever, small-pox, scarlet fever*, or *diphtheria* in a person or persons destitute of a home or occupying a hotel or other public place of resort, or a private family under circumstances which, in the judgment of said officers, shall work especial hardship, to secure a place as secluded as practicable to which such sick person or persons shall be removed. The above-named officers shall supply the needed subsistence, nursing, medicine, &c., the necessary length of time, and they shall have the power to make the necessary provisions in advance for the care of persons affected with either of the above-named diseases when in their judgment public safety or economy may require it.

SEC. 7. It shall be the duty of the city marshal and the police force under his direction to see to it that any sign of warning of *cholera, yellow fever, small-pox, scarlet fever*, or *diphtheria* is not torn down, defaced, or otherwise destroyed or removed until such time as its removal shall be ordered by the health warden or attending physician; to replace such warning of removal; and to trace, find out, and prosecute any person or persons who shall illegally deface, destroy, or remove such warning, or shall violate or neglect any of the provisions of this ordinance.

SEC. 8. The health warden shall receive a salary of one hundred and fifty dollars per annum.

SEC. 9. This ordinance shall be in force from and after its passage and legal publication.

Passed June 3, 1880.

Attest: J. R. LOAR, *Mayor.*

J. W. MELTON, *City Clerk.*

The following is the form of report for contagions diseases, in accordance with ordinance passed June 3, 1880:

JACKSONVILLE, ILL., ——— —, 188-.

To the Health Warden:

SIR: You are hereby notified that the following described person has been attacked with ———:

Name, ——— ———; age, ———; color, ———; sex. ———; nationality, ———: date, ——— —, ———.

Residence, No. —, ——— street.

——— ———, M. D.

ORDER RELATING TO RIVER COMMERCE IN ILLINOIS.

The following order was received on the 21st instant from Dr. John H. Rauch, secretary of the Illinois State board of health, and was issued on the 21st of July, 1880, by the honorable the mayors of the following cities and towns: East Saint Louis, Chester, Grand Tower, Cairo, Mound City, Metropolis, Golconda, Elizabethtown, and Shawneetown:

"For the purpose of preventing the introduction of yellow fever into this State, and to promote the sanitation of the Mississippi and Ohio Rivers, you will please hereafter not allow a steamboat to land, coming from below Cairo, at your port, unless upon presentation of a clean certificate of inspection as to cargo, passengers, officers, and crew, signed and indorsed by an inspector of the National Board of Health."

ABSTRACTS FROM CONSULAR REPORTS.

CARDIFF, WALES.—United States Consul Wirt Sykes reports a case of small-pox on board a vessel arriving from the port of Rouen. The seaman was taken ill during the passage. He was immediately removed to Hamadryad Seaman's Hospital, and a disinfection of the vessel was efficiently made. The remainder of the crew have been kept under supervision, with the co-operation of the dock-master, and isolation of the ship as far as practicable carried out; no new case has yet shown itself.

DEMERARA.—Under date of June 26, United States Consul Philip Figyelmesy forwards papers containing the following statistics of this colony:

The boundaries of Demerara have never been accurately defined, but the total area was computed by Sir Robert Schomburgh at 76,000 square miles. By the census of 1871, the population was estimated at 113,491, exclusive of troops and sailors in port, and about 7,000 aborigines. An approximate division of the population, other than native, gives 6,295 Chinese, 7,925 natives of Madeira and the Azores, 13,385 natives of West Indies, and 7,541 Africans, the remainder being from various other places. The births registered in 1879 were 9,211, being 2,476 in excess over the deaths, which were 6,735. The record of marriages is very incomplete, though all ministers of religion are required by law to deposit in the register's office duplicate registers of all marriages solemnized by them.

The hospital returns show a total of 6,353 admitted, and 372 remaining from 1878. Of these 6,725 patients, 718 died, or 10.6 per cent. There were 3,238 discharged as cured, and 1,992 as relieved. The least air space per patient in any ward was 563, and the greatest 2,398 cubic feet. Rain-water alone is used for drinking and cooking. The privies are on the dry-earth system, and lime is also used.

The Colonial and Seaman's Hospital reports for the year 4,829 cases and 589 deaths. The following proportions of cases to deaths are given: Consumption, 197 cases to 140 deaths; malarial fevers, 425 to 5; diarrhœa, 190 to 56; dysentery, 131 to 35; rheumatism, 271 cases, no deaths; syphilis, 229 to 4; cardiac dropsy, 104 to 48; renal dropsy, 60 to 19; leprosy, 77 to 7; epilepsy, 17 to 2; apoplexy, 14 to 13; other brain diseases, 40 to 8; heart disease, 25 to 8; bronchitis, 188 to 31; pneumonia, 55 to 29; pleurisy, 19 to 2; ascites, 34 to 19; jaundice, 32 to 5; Bright's disease, 25 to 14; ulcers, 938 to 10; abscess, 180 to 4; debility, 225 to 81; anæmia, 160 to 15; accidents and injuries, 275 to 14.

The report from the Leper Asylum shows 206 remaining from 1878, and 42 admitted in 1879. Of these 248, there were removed 47, left without permission 13, and expelled 3, leaving 124 December 31, 1879. Twenty-eight deaths occurred among the lepers, of which number 14 were natives of Guiana, 3 from Barbadoes, 3 from Africa, 2 from Madeira, and 6 from China and the East Indies. In many of these cases the immediate cause of death was some intercurrent disease; in one-half the cases no complication is noted. Those patients who are able to work are employed in gardening, &c., at the asylum.

The Insane Asylum reports 306 patients and 39 deaths during the year; no restraint is employed, and it is stated that accidents or injuries rarely result from the liberty allowed.

HONOLULU, SANDWICH ISLANDS.—United States Consul F. P. Hastings forwards the report of the board of health for the two years ending March 31, 1880. During that period measles and mumps were prevalent, but not fatal. Typhoid fever is noted as having caused no more than ordinary mortality among the other races on the island of Hawaii, but as having been so fatal among the natives as to threaten their extermination at no distant day. This mortality is chiefly ascribed to their refusal to avail themselves of medical aid and care, 311 out of 543 having died without such attendance. An earnest appeal is made by the president of the board, Samuel G. Wilder, to induce the natives to accept the gratuitous provision made for them in the hospital organized by Kamehameha IV and other institutions. The questions of sewerage and privies are fully discussed, and estimates given to show that the *Pail* or Rochdale system would be most effective and economical at Honolulu. The agent of the board of health reports 638 deaths for the year ending March 31, 1879. Of the decedents, 543 were Hawaiian, 46 Chinese, 18 British, 13 from the United States, and the remainder from all parts of the world. Died without medical attendance, 331, or nearly 52 per cent. There were 156 deaths under 5 years, and 88 over 70 years of age. Among the causes of death were typhoid fever 153, old age 70, whooping-cough 61, consumption 49, dropsy 55, debility 44, dysentery 26, cholera infantum 18, acute lung diseases 16, heart diseases 12, brain and nervous system 32, syphilis 11, diphtheria 3, liver diseases 3, suicides 3, accidents 9, and 37 from causes unknown. For the year ending March 31, 1880, the total of deaths was 745, of which 300, or 40.2 per cent., were unattended. The deaths under 5 years were 137, and 69 were over 70 years of age. Of the decedents, 550 were Hawaiian, 81 Chinese, 25 British, 27 from the United States, 18 Portuguese, 22 Pacific Islanders, 9 German, and the remainder divided among seven nationalities. Among the causes of death, in numerical order, were typhoid fever 196, consumption 96, unknown 95, dropsy 56, old age 55, debility 41, dysentery 28, diseases of brain and nervous system 48, diseases of heart 15, acute lung diseases 10, whooping-cough 7, measles 4, suicides 4, and accidents 15. The report from the Insane Asylum shows that there were 30 patients on April 1, 1878; of these 21 were natives, 1 negro, 6 Chinese, 1 German, and 1 American. Since that date 45 have been admitted. Of the 75 patients 23 have been discharged and 17 died, leaving 35 under care. Of these, 24 are Hawaiian, 6 Chinese, and 5 of various nations. In the Leper Hospital, island of Molokai, there were 684 patients March 31, 1880, three being children of lepers, and under 1 year of age. There were 424 males and 260 females. The greater portion of the lepers are treated as out-patients, and it is stated that a large number remain mixed with the people in the several islands. The average mortality among the lepers in the establishment at Molokai has been nearly 58 per 1,000 per annum. Dr. N. B. Emerson, physician to the establishment, remarks that on the approach of damp and chilly weather in November there is a general aggravation of symptoms in leprous persons, with fresh eruptions, attended with chill and fever closely resembling intermittent. Dr. Emerson concludes that while much may be done to palliate, no curative means have yet been found in this disease. He is convinced that the disease is contagious, and states that, though first introduced into the Sandwich Islands about 1856, there are now thousands of lepers, and the disease is still rapidly increasing among the native population.

ISLANDS OF MALTA AND GOZA.—The report for the two weeks ending June 30 gives a total of 181 deaths, of which 3 were by small-pox, 1 by measles, 1 by croup, 1 by typhoid fever, and 6 by diarrhœal diseases. The annual rate of mortality was 35.1.

MELBOURNE, AUSTRALIA.—For the month of April there were 398 deaths, of which 20 were by typhoid fever, and 11 by other contagious or infectious diseases. A decrease in the number of deaths, compared with the previous month, has taken place.

MILAN, ITALY.—United States Consul D. J. Crain sends the following report, under date of June 16, on the manufacture of quinine and other alkaloids from cinchona bark in Italy:

The manufacture of the salts and sulphate of quinine is an important Italian industry. It has been carried on at Milan and Genoa since 1870. Twenty-two thousand five hundred pounds are consumed yearly in Italy, of which one-half is made at Milan, 6,750 pounds at Genoa, and the balance imported from Germany. Forty-five thousand pounds of quinine and salts of quinine are produced in Italy. The production of the world is estimated at from 230,000 to 260,000 pounds per year, as follows: Germany, 56,250 pounds; Italy, 45,000 pounds; France, 40,500 pounds; England, 27,000 pounds; America, 63,000 pounds; India, 12,250 pounds.

The two Italian factories produce 45,000 pounds of the sulphate of quinine, viz: 40,500 pounds at Milan, 4,500 pounds at Genoa. The first of these employs 45 hands, the second 15.

The Milan factory ships largely to all parts, furnishing much to Russia, France, and Austria. England receives two-thirds of her supply and Holland one-half of hers from the same source.

Efforts will be made to acclimatize the cinchona in Italy, to increase the supply and lessen the cost of the product. Its successful culture in India and Ceylon encourages the belief that it will grow wherever the soil is dry, the rain-fall large, and climate temperate. Many parts of the United States meet these conditions, and notably where its product is needed.

The culture of the cinchona in our country would cheapen an indispensable medicine and open a new industry to capital and labor.

In this connection some facts reported by Mr. E. Van Estvelde, the consul-general of Belgium in Italy, are instructive. He reports that the best varieties of cinchona have been successfully acclimated in British India. The government there cultivates chiefly the *Cinchona succirubra*, which has a red bark and contains a large quantity of febrifuginous alkaloids, and the *Cinchona calisaya*, which has a yellow bark, and is better suited to the manufacture of quinine. The culture of the first has succeeded. Uncertainty still exists as to the *Cinchona calisaya*, and the Bengal government are examining the plantations of Java, where it has been cultivated with entire success.

The cinchona plantations are in two distinct regions of India, *i. e.*, north of the Nilgiri Hills, in the Madras Presidency, and on the slopes of the Himalayas.

Those of the government are as yet the most important, covering 1,300 acres on the Nilgiri Hills and nearly 3,000 acres in Sikkim. There are several private plantations of later date already producing marketable bark.

The red bark (*Cinchona succirubra*) has many febrifuge alkaloids, but little quinine. It was important, therefore, to determine the therapeutic value of these alkaloids and the cheapest means of extraction in order to furnish a good febrifuge at a moderate price. The medical commission recommended the extraction of cinchonine, cinchonidine, and of quinine by simple means, and the government now

sells a mixture of these three alkaloids under the name of "Cinchona Febrifuge."

As the price does not exceed 65 cents per ounce, this febrifuge is used in nearly all the hospitals of India and sold in large quantities to the public. The chief surgeon of the northeast provinces reports that the doctors are unanimous in declaring that the "cinchona febrifuge" is a medicine of recognized efficiency in the treatment of ordinary intermittent fevers, and that it is an excellent prophylactic for those who live or travel in marshy countries. Most doctors are, however, of the opinion that it is inferior to quinine as a therapeutic agent: that its effect is slower, and that it is insufficient to cure severe remittent fevers. That it is a medicine of value is shown by the increase of its use, which, as the following figures show, is remarkable: 1874–75, 48 pounds; 1875–76, 1,940 pounds; 1876–77, 3,750 pounds; 1877–78, 5,162 pounds; 1878–79, 7,007 pounds.

The hospitals took more than 5,500 pounds in 1878–79; and, as the use of quinine diminished in the same time about as much, it is proof, considering the cost of the last-named alkaloid, that the Indian Government saved about $125,000.

At the present time the government chemist of India is trying to produce a better febrifuge by mixing three sulphates, viz, cinchonine, cinchonidine, and quinine, of which the cost would be little higher.

Financially the plantations of Sikkim gave last year a net profit of $19,252.80, although not fully developed, or 4½ per cent on the sum invested. By the prevention of disease the hospital expenses of the government were largely lessened.

The value of these facts in their relation to the United States is apparent.

MOSCOW.—United States Consul August Weber reports: For the month of February there were 1,137 deaths, of which 9 were by small-pox, 151 by typhoid fever, and 176 by other contagious or infectious diseases. The prevailing diseases were chronic pneumonia, 280 deaths; catarrhus gastro-intestinalis, 260; affections of acute respiratory organs, 261. Almost total want of drainage and the worst of pavements are the chief causes, especially in summer months, of the unhealthy condition of the city.

For the month of March there were 1,477 deaths, of which 14 were by small-pox, 177 by typhoid fever, 185 by other contagious or infectious diseases, 365 by pneumonia chronic, 307 by catarrhus gastro-intestinalis, and 431 by affections of acute respiratory organs.

NASSAU, BAHAMAS.—United States Consul Samuel P. Saunders reports that during the week ending July 10 yellow fever, or fever very much resembling it, has made its appearance in this island; confined to the suburbs of the city at present. Of the eight cases referred to, six have been that of children under fifteen. *Symptoms*, high fever, violent headache, and pains in back and limbs, followed in 36 or 48 hours with black hemorrhagic vomiting, dying after three days' illness.

PORT LOUIS, MAURITIUS.—United States Consul H. C. Marston, under date of June 18, forwards mortality reports for May, 1880, and comparative statement of the same month for the four previous years:

During May, 1880, there were 1,003 deaths, 600 of which were from fever; annual rate per 1,000, 33.7. May, 1876, 939 deaths, 535 fever; rate per 1,000, 32.6. May, 1877, 1,492 deaths, 962 fever; rate per 1,000, 49.6. 1878, 769 deaths, 406 fever; rate per 1,000, 26.4. 1879, 1,088 deaths, 600 fever; rate per 1,000, 36.6.

RIGA, RUSSIA.—United States Consular Agent P. Boulholdt, under date of July 5, states that although there is a sanitary commission in this city no records are kept of births, deaths, or prevailing diseases. Only in case of epidemics some information can be obtained from the medical authorities. The population is estimated at 130,000. There is no drainage, the refuse being removed in carts; but the sanitary condition of the city is superior to that of many of the larger towns in the interior.

SANTA CRUZ, ISLAND OF PALMA, CANARIES.—For the month of May there were 11 deaths; no prevailing diseases, and sanitary condition of city good.

SIDNEY, AUSTRALIA.—For the month of February there were 190 deaths, of which the proportion of zymotic diseases was 19.5 per cent., typhoid fever 4, and diarrhœa 22, being the principal causes of death.

For the month of March there were 210 deaths, of which zymotic diseases gave 16.2 per cent.; typhoid fever, 4; diarrhœa, 21.

For the month of April, 180 deaths; zymotic diseases, 17.8 per cent.: by typhoid fever, 7; dysentery, 5; diarrhœa, 6.

SINGAPORE.—United States Consul A. G. Studer reports for the first two weeks of June that there has been no appearance of any epidemic or infectious disease in the port or vicinity.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

FORT WASHAKIE, WYO.—Under date of July 17, Dr. W. H. Corbusier, U. S. A., states that measles, which for eight months past have been epidemic in a mild form among the citizens and Indians of the surrounding country, have again appeared at the post; two children in one family have been attacked.

KINGSTON, N. Y.—Dr. J. D. Terwilliger writes under date of July 17, that "burial permits are now required in that city: malarial fevers prevail to a considerable extent, and diarrhœal diseases are prevalent among small children, but mortality is not great."

LONDON, *July 26.*—A dispatch of this date states that the English steamer Derwent has arrived at Havre from the West Indies with yellow fever on board. Three persons died of the fever on the passage and 18 are convalescent.

PENSACOLA, FLA.—Dr. J. C. Whitney writes under date of July 20, 1880, that a case of "Chagres fever" occurred on board the schooner L. B. Wing, from Aspinwall, at Pensacola, and suggested to the local board the propriety of detaining said vessel for further developments.

SAN ANTONIO, TEX.—Dr. W. L. Coleman writes under date of July 15, that "malarial fevers have been more prevalent in San Antonio than ever before, and that several car-loads of rags have been shipped north from this point, which have been gathered principally by Mexicans among whom small-pox prevailed last year; it is possible that these rags may convey the germs of that disease to the points to which they are shipped, and it would be well for the authorities to look after them."

SILVER CLIFF, CUSTER COUNTY, COLORADO.—Dr. A. Comstock writes under date of July 20, 1880, that this is a two-year old infant city of between 5,000 and 6,000 occupants, located by chance, like so many mining camps, in the mineral-bearing portions of our frontier. The elevation, by reports of Professor Hayden and surveys of the Denver and Rio Grande Railroad, is 7,800 feet above sea level. The entire "bench" or shoulder lying between the foothills of the Wet Mountains and the valley of Grape Creek, which stream is the outlet for the drainage of the Wet Mountain Valley into the Arkansas River, has a surface slope of about five degrees. It therefore leaves very little tendency to form cañons or ravines, and the drainage is ample for sanitary purposes. The raintall, excepting along the mountain ranges, is very slight, not exceeding, by observation, about 20 inches annually, and nearly one-half of this falls during the month of afternoon showers—namely, July. The Wet Mountains lie in an easterly and the Sangre de Cristo Range in a westerly direction from the town, with a spur of the latter flanking us to the north, and which latter the Arkansas River breaks through, forming the widely famed "Grand Cañon." Thus we are surrounded on all sides but one by mountains, which have isolated peaks and hunettes above the snow line, and retain in certain basins some snow the year round. The Sangre de Cristo Range is about seven and one-half miles from us at the base in an air line, and not far from ten miles at the summits. The prevailing winds are from the southwest and are very constant, so much so that the early Jesuits called the valley "La Mo-ha-do," or "The Place of Winds." The mean temperature is low all the year, and even in midsummer the sun is oppressive only for a few hours, and the evenings cool, so much so, indeed, that not less than one-half of them in July are not comfortable inside the house without a slight fire. The daily variation in temperature is not unfrequently forty degrees, and sometimes sixty; the daily mean range is about 30°; the monthly mean range about 60°; annual range 120°. The difference occasioned in temperature from the shading of the sun, either by a passing cloud or an umbrella, is more obvious than in any other country I am acquainted with. The prevailing maladies are those of the circulatory and respiratory organs, and, with rare exceptions, persons suffering from either of the above, or from kidney affections, should avoid such close proximity to the mountains. Epidemic typhoid fever was reported as being very prevalent during the month of October, last year, and can be traced to causes easily remedied, but it is difficult to convince the authorities of its gravity. The water supply comes from springs near Grape Creek, and is brought to the town in tanks, from which each household is supplied daily, but many are so reckless as to keep the same two or more days in a stagnant condition. Much inconvenience arises from the absence of a running water supply, as no shade trees nor vigorous vegetation exists. There is no law enforced by which a record of births or deaths is available. No burial permits are required, and none of the medical faculty have been accustomed to keep notes of their cases. Most of the population are males, but with an increasing proportion of women and children as the place improves in domestic facilities. The death rate I cannot ascertain, but the indications are that it is very low, and it is, *for a mining camp*, the best regulated and, beyond any question, the healthiest in the State. The dust storms and the vegetable spores carried in the atmosphere are the greatest present enemies to comfort and health.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JULY 17, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

States and cities.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	FEVER.

NOTE.—Boston has 370,000 white, 5,000 colored; deaths, 153 white, 5 colored. Rate per 1,000, white 21.6, colored 52.2. Providence has 104,760 white, 4,000 colored; deaths, 52 white, 2 colored. Rate per 1,000, white 25.9, colored 26.1. Wilmington, Del., has 38,000 white, 6,000 colored; deaths, 18 white, 6 colored. Rate per 1,000, white 20.1, colored 52.2. Baltimore has 338,334 white, 55,412 colored; deaths, 181 white, 50 colored. Rate per 1,000, white 27.9, colored 47.2. District of Columbia has 114,000 white, 56,000 colored; deaths, 45 white, 46 colored. Rate per 1,000, white 20.5, colored 42.7. Norfolk has 14,000 white, 11,300 colored; deaths, 11 white, 9 colored. Rate per 1,000, white 38.5, colored 41.6. Richmond has 37,955 white, 26,697 colored; deaths, 20 white, 20 colored. Rate per 1,000, white 22.2, colored 29.2. Lynchburgh has 10,000 white, 11,000 colored; deaths, 4 white, 6 colored. Rate per 1,000, white 20.9, colored 28.5. Charleston has 25,000 white, 32,000 colored; deaths 7 white, 35 colored. Rate per 1,000, white 14.6, colored 56.7. Savannah has 18,229 white, 15,019 colored; deaths, 3 white, 12 colored. Rate per 1,000, white 8.5, colored 41.5. Augusta has 16,176 white, 10,824 colored; deaths, 5 white, 7 colored. Rate per 1,000, white 16.2, colored 32.8. Atlanta has 25,373 white, 16,175 colored; deaths, 9 white, 4 colored. Rate per 1,000, white 19.9, colored 32.8. Mobile has 28,000 white, 12,000 colored; deaths, 8 white, 6 colored. Rate per 1,000, white 14.9, colored 26.1. Selma has 3,425 white, 4,089 colored; deaths, 1 white, 5 colored. Rate per 1,000, white 15.2, colored 63.9. Jacksonville has 6,000 white, 4,000 colored; deaths, 4 white, 3 colored. Rate per 1,000, white 34.8, colored 39.1. New Orleans has 155,000 white, 55,000 colored; deaths, 68 white, 32 colored. Rate per 1,000, white 22.9, colored 30.4. Shreveport has 3,916 white, 4,117 colored; deaths, 1 white, 2 colored. Rate per 1,000, white 13.3, colored 24.7. Nashville has 27,871 white, 15,669 colored; deaths, 18 white, 16 colored. Rate per 1,000, white 20.7, colored 52.8. Clarksville has 3,000 white, 3,000 colored; deaths, 1 white, 2 colored. Rate per 1,000, white 17.4, colored 34.8. Chattanooga has 8,000 white, 5,000 colored; deaths, 5 white, 2 colored. Rate per 1,000, white 32.6, colored 20.9. Louisville has 153,125 white, 21,875 colored; deaths, 41 white, 11 colored. Rate per 1,000, white 14.0, colored 27.1. Total white population, 1,510,000; deaths, 655; annual rate per 1,000, 22.6. Total colored population, 411,471; deaths, 291; annual rate per 1,000, 36.9.

The following reports for the week ending July 17 are from places requiring burial permits and having less than 5,000 population:

Bridgewater, Mass., 1,000; no deaths. Brunswick, Ga., 3,900; deaths, 1, under 5 years. Edgartown, Mass., 1,400; no deaths. Morgan City, La., 2,018; no deaths. Murfreesborough, Tenn., 3,800; deaths, 1; under 5 years, 2; diarrhœa 2, lung diseases 2. Nantucket, Mass., 3,679; deaths, 3; enteric fever 1. Shelbyville, Tenn., 1,911; deaths, 2; consumption 2. Total population, 20,708; deaths under 5 years, 3; total deaths, 10; annual rate per 1,000, 25.2.

The following reports for the week ending July 17 are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 10; under 5 years, 5; consumption 2, diarrhœa 1, lung disease 1. Allegheny, Pa., 78,000; deaths, 25; under 5 years, 10; consumption 3, diarrhœa 7, enteric fever 1, lung disease 1. Bath, Me., 10,000; deaths, 2; diarrhœa 1. Battle Creek, Mich., 7,500; deaths, 3; under 5 years, 1; diarrhœa 2. Boulder, Colo., 3,030; deaths, 2; under 5 years, 1; consumption 1, diarrhœa 1. Brattleborough, Vt., 6,000; deaths, 1. Calais, Me., 6,162; deaths, 1. Cambridge, N. Y., 1,850; deaths, 1. Carrollton, Miss., 700; no deaths. Cedar Keys, Fla., 1,500; deaths, 2; under 5 years, 1; malarial fever 1. Rock Island, Ill., 12,000; deaths, 3; under 5 years, 1; diarrhœa 1. Springfield, Ohio, 21,000; deaths, 6; under 5 years, 4; consumption 1, diarrhœa 3. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 5; under 5 years, 3. Tampa, Fla., 1,200; deaths, 1; consumption 1. Titusville, Pa., 9,000; deaths, 4; under 5 years, 3; croup 1, diarrhœa 1, enteric fever 1. Tuskaloosa, Ala., 2,000; deaths, 2; under 5 years, 2. Winchester, Va., 5,000; deaths, 2; under 5 years, 1; diarrhœa 1. Winona, Minn., 10,000; deaths, 1; under 5 years, 1. Youngstown, Ohio, 15,000; deaths, 3. Total population, 442,951; deaths under 5 years, 106; total deaths, 221; annual rate per 1,000, 25.7.

MISCELLANEOUS.

Rear-Admiral Wyman, in a dispatch to the Navy Department of July 21, states that "St. Jago de Cuba is in a most unhealthy condition, which I do not find mentioned in the NATIONAL BOARD OF HEALTH BULLETIN of June 26. There were 131 cases of yellow fever and 102 cases of small-pox during the month of June; about one-half of those attacked recovered."

Note.—No reports have been received from the consul at Santiago de Cuba for any part of the month of June.

Dr. W. M. Clark, secretary State board of health of Tennessee, writes under date of July 20, that it is the intention of the State board of health to place inspectors at Grand Junction, Corinth, Decatur, and probably Chattanooga.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, AUGUST 7, 1880. [No. 6.

GAUGING OF PUBLIC SEWERS.

[Report of GEORGE E. WARING, JR.]

NEWPORT, R. I., *July* 19, 1880.

SIR: Appended hereto please find my report on the gangings of sewers in different parts of the country, which have been carried on during the past year under my direction by the order of the National Board of Health.

Respectfully, yours,

GEO. E. WARING, JR.

DR. T. J. TURNER.
Secretary National Board of Health.

The purpose of these gaugings was to determine the size of conduit needed for the removal of the greatest amount of sewage matter produced by given populations; in other words, to determine the degree to which it would be safe to reduce the sizes of public sewers in cases where the object is only to remove the foul sewage matters of households, manufacturing establishments, public institutions, &c. No attempt was made at an elaborate scientific examination of the flow, beyond what was necessary for this one purpose.

It has been almost the universal custom up to this time, in planning a system of sewers for a town, large or small, to regulate the sizes of the sewers with a view to the removal not only of domestic and manufacturing wastes, but also of a considerable amount of rain-fall. This custom is open to several objections:

(1.) Sewers large enough for the removal of storm-water are so much too large for domestic sewage that they must inevitably be foul and in a bad sanitary condition, except when flushed by storm-water. As storm-water is often withheld for many weeks together, and often at a season when the decomposition of deposits in the sewer is most active and injurious, this condition constitutes a very grave sanitary defect.

(2.) While the cost of storm-water sewers may be borne with tolerable ease in a city where the whole abutting property is built up, the distribution of such a charge among the scattered inhabitants of a more village-like town, where lot fronts are often very much larger than in the city, constitutes a serious burden—so serious, indeed, as to be in many instances prohibitory.

(3.) Aside from the foul air produced in the sewers themselves, the decomposition of the filth which accumulates in the catch-basins, by which street-water is admitted to the sewers, is often a source of most serious offense, if not of danger.

(4.) By extending the underground removal of storm-water to the very crests of the elevations of a town, the gutter flow, even at points where it could cause no inconvenience, is so much reduced as to prevent the cleansing of the gutters, which would otherwise be effected with each storm.

So serious are the objections above cited, that I have found in more than one case serious opposition to the construction of sewers on the part of local sanitary authorities. In Baltimore, for example, where the removal not only of surface water, but of the liquid wastes of households, is effected by surface drainage only, a very influential portion of the community strenuously resists all projects for sewerage, because of the advantage that they believe now to be derived from the cleansing effect of storm-water flowing through the streets.

It seems to me more than questionable whether it would not be better to preserve the surface removal of rain-water in all parts of the town where its accumulation would rarely amount to a serious interference with the use of the streets, and where injury to private property is not to be apprehended. This would enormously reduce the length and consequently the cost of the storm-water system, and would at least confine to certain limited localities the objectionable features which are now so prominent.

There seems to be good ground for the belief that if the sizes of sewers can be adjusted to the removal of foul wastes only, not only will their condition be very much improved, but their cost will be so vastly reduced as to bring their advantages within the reach of the smallest communities.

As the most important step in determining the practicability of the changes above indicated, the National Board of Health commissioned me to institute such a series of gaugings as would determine the actual pipe capacity required. Formulæ in use among engineers would lead to substantially the same result with actual gaugings; but their educational effect would be less marked, because calculations based upon scientific formulæ are less readily comprehended by the average municipal ruler.

In pursuance of the instructions of the Board, I have instituted the following gaugings:

a. A sewer in Madison avenue, in New York, having, with its branches, a total length of about 7,000 feet, and occupying a district about half built up with houses of good class.

b. A sewer in a single street in Providence, R. I.

c. A sewer with a single short branch in Burlington, Vt.

d. Six sewers in a closely-built part of the city of Milwaukee, Wis.

e. The sewers draining the New York State Lunatic Asylum, at Ponghkeepsie.

f. A characteristic sewer in the city of Poughkeepsie, N. Y.

g. The sewers draining the Massachusetts Hospital for the Insane, at Taunton, Mass.

h. A large sewer in Saint Louis, Mo.

The total result of these gaugings affords a very fair average result, covering a sufficient variety of conditions, upon which I submit the following summary of the facts developed:

Madison avenue sewer, New York.

This gauging was intrusted to Stevenson Towle, esq., civil engineer, the engineer in charge of the sewer department of New York, who kindly consented to make the investigations. Unfortunately, his other occupations did not enable him to complete the work, and I am only able to say that the greatest flow of the Madison avenue sewer was discharged through a notch (in a wier) 4 inches wide, which it filled to a depth of 3½ inches.

Providence, R. I.—Pine street sewer.

This investigation was made by J. A. Judson, esq., civil engineer, whose report may be summarized as follows: The total length of this sewer is 1,391 feet. Its grade varies from 0.86 per 100 to 4.18 per 100. The district which it drains contains 60 houses, all of which are residences, and 41 of which are connected with the sewer. The ganging in this, as in all other cases, was taken at the time of the greatest use of water of the week, in this case on Monday morning, between the hours of 8 and 11. The depth of flow was measured at intervals of 15 minutes. The population tributary to the sewer numbers 267. The result showed that the greatest flow of sewage reached a depth of 0.4375 inches in the 12-inch sewer. In the reducer, which brought the current into a channel having a radius of 3 inches, the greatest depth of flow was 0.875. A pipe 1.84 inches in diameter, running full at the same velocity, would carry the greatest flow of sewage from this population of 267.

Burlington, Vt.—College street sewer.

This gauging was made by A. R. Dow, esq., city engineer. The total length of this sewer and its branch is 2,790 feet. Its grade varies from 0.435 per 100 to 3.39 per 100. The district which it drains contains 85 houses, of which 54 are connected with the sewer. Forty-nine of these are dwelling-houses, and 5 are stores and shops. The population tributary to the sewer embraces 325. The ganging was taken at intervals of 15 minutes from 7.30 a. m. to 10.30 a. m. The result showed that the greatest flow of sewage reached a depth of 1.2 inches in a pipe of 3-inch radius. A pipe 2.25 inches in diameter, running full at the same velocity, would carry the greatest flow of sewage from this population of 325 persons.

Milwaukee, Wis.

These ganges were made by A. H. Scott, esq., civil engineer, of the city engineer's office, in the sewers of Detroit, Martin, Chestnut, Biddle, Wisconsin, and Huron streets.

The gangings of the Huron street sewer are of especial significance. This sewer is 42 inches in diameter. The grade of the sewer at the point where the gaugings were taken was about 1 in 400. The area tributary to the sewer is about 70 acres, all nearly level, closely built, containing 500 houses, mostly dwellings, and a total population of 4,035. One hundred and thirty-two of the buildings are not connected with the sewer; the remaining 368 buildings contain a total population of 3,177, all of whom are tributary to the

sewer. There are several hotels, saloons, small factories, and livery stables; so that the district is fairly representative of an average city area.

The greatest flow in the main sewer on "washing day"—the greatest flow of the week—attained a depth of 6 inches, the diameter of the sewer being 42 inches.

The channel being reduced to a diameter of 10 inches, the greatest depth of the flow was 4.5 inches. Reduced to a diameter of 8 inches the depth remained the same—4.5 inches. Reduced to a diameter of 6 inches, it reached a depth of 5.5 inches.

The influence on the velocity of the stream by increasing its hydraulic mean depth is illustrated by the following figures:

"Forty-two-inch sewer, 6 inches deep; cross-section of stream, 121.3 square inches.

"Ten-inch sewer 4.5 inches deep; cross-section of stream, 33.1 square inches.

"Eight-inch sewer 4.5 inches deep; cross-section of stream, 27.7 square inches.

"Six-inch sewer, 5.5 inches deep; cross-section of stream, 27.14 square inches."

Poughkeepsie, N. Y.—Hudson River State Hospital.

This ganging was made by J. A. Judson, esq., civil engineer. This institution uses a daily average of about 80,000 gallons of water. The entire waste, including boiler-house, laundry, and kitchens, is discharged through a main sewer 12 inches in diameter. Its least fall is 1 foot in 100 feet, and its *average* fall is about 5 feet in 100 feet, so that its contents flow at high velocity. On the day of examination, January 17, 1880, the hospital had 301 inmates—211 patients and 60 employés. The flow was measured between 9 a. m. and 12 m., at intervals of 10 minutes. The maximum discharge took place at 9.30. The channel was reduced to a diameter of 6 inches, and the measurements were made with a thin strip of wood set edgewise to the current. The maximum flow attained a depth of 3.25 inches. At 9.29 it had attained 2.50 inches, and at 9.40 it reached only 2.75 inches. At 11.20 it again touched 3 inches.

A concise statement of the case would be this: 301 persons consuming 80,000 gallons of water per day, being 265 gallons per head, produced an amount of sewage sufficient at its maximum to create a stream in a 6-inch pipe 3¼ inches deep.

The greatest flow (3.25 inches) would have been carried by a pipe 4.25 inches in diameter, running full at the same velocity.

Poughkeepsie, N. Y.—Market street subdistrict sewer.

This ganging was conducted by J. A. Judson, esq., civil engineer. This is a 15-inch vitrified pipe sewer, draining Church street, Noxon street, and a part of Market street. The total length of the sewer delivering at the point of ganging is 2,766 feet. The number of houses tributary to the sewer was 39, and the population 426. The greatest flow of their sewage, measured in a pipe 6 inches in diameter, was 2.25 inches. It might all have been carried in a pipe a trifle more than 3 inches in diameter.

Taunton, Mass.—State Lunatic Hospital.

The gaugings at this hospital were conducted by J. A. Judson, esq., civil engineer. This hospital is situated about one mile south of the city, on elevated ground, near Mill River. The building is large and is abundantly supplied with water from its own steam-pumping works, about 40,000 gallons per day being used for all purposes, including the laundry. The main sewer is a 10-inch iron pipe. This sewer carries away, in addition to roof water, the entire waste of the establishment with the exception of the laundry, which delivers through an independent sewer to be referred to hereafter.

The flow of the 10-inch sewer was reduced to a diameter of 6 inches, and gaugings were taken at the usual intervals of 10 minutes during the time of the greatest use of water in the establishment. The summary of the report shows that the population occupying this hospital, 659 in number, produced sewage matter from all sources, except the laundry, sufficient to cause a depth of flow in the 6-inch pipe of only 1⅞ inches at the greatest. A sewer 3 inches in diameter (2.96) would, with a flow of the same velocity, discharge the greatest amount yielded by this population.

A separate investigation of the flow of the laundry sewer showed very great variations, due to the fact that sometimes one and sometimes all of the large washing machines, five in number, were emptied suddenly, producing a great momentary increase. The minimum flow between 9.30 and 11.30 a. m. was less than 1 inch in depth (.875). At 10.40 a. m. the maximum flow was produced by the simultaneous emptying of all the machines. This raised the depth of water in the 6-inch pipe to 2½ inches. In 10 minutes it had fallen to 1½ inches. The maximum flow would have been carried at the same velocity through a pipe 3.50 inches in diameter.

The entire maximum flow of the two sewers would have been carried, supposing the velocity to be the same, in a pipe 4.58 inches in diameter. (It is worthy of notice that it has been seriously proposed that the State of Massachusetts should pay one-half of the cost of a large 5-foot sewer because of its contributing to the sewage of the town this small stream, which would be amply accommodated by a 6-inch pipe.)

Saint Louis, Mo.—Compton avenue sewer.

This gauging was made under the direction of Robert Moore, esq., civil engineer, commissioner of sewers of Saint Louis. The sewer drains an area containing 1,370 houses, occupied by a population of 8,200. The total number of water taps was 1,391. The diagrams show gaugings taken every hour from 6 p. m., Monday, March 15, to 11 a. m., March 16, and from 8 a. m., March 19, to 8 a. m., March 23. These gaugings are averaged to make a typical day, in which, beginning at midnight with a flow of 75.32 cubic feet per minute, the flow was reduced to 70.26 cubic feet per minute at 2 a. m.; then it went 71.87 cubic feet per minute at 6 a. m.. 130.26 cubic feet per minute at 11 a. m., 123.86 cubic feet per minute at 3 p. m., and steadily declined from this time until midnight, when the flow was 75.15 cubic feet per minute. The sewer is 7 feet 3 inches in diameter. It was obstructed by a dam, into which was built a 12-inch vitrified pipe sewer, which was continued for a length of 20 feet. The gaugings were taken simultaneously at three different points, the average of these being the assumed depth through the 20 feet of 12-inch pipe. The greatest depth reached in this pipe was less than 7 inches (.5833 feet). Flowing at the same velocity, the whole stream would have been carried by a sewer a trifle more than 9 inches in diameter.

A computation of the amount of flow as compared with the population makes it evident that the sewer must have received a very large amount of ground water, for the total flow (over 1,000,000 gallons per day) amounted to more than 130 gallons for each member of the population, which, in a district having only about one water tap to each house, would be an impossible amount. It is usual to estimate a maximum daily use for domestic purposes of about 33 gallons per head of population. Deciding the total flow by this amount, we might assume that the 12-inch pipe used in this instance, carrying, at its maximum, less than 7 inches in depth of water, was doing the amount of work that would be required for removing the sewage only of a population of over 30,000, supposing the sewers to be absolutely tight so that only household wastes should enter them. This last example is, from its extent and from the minuteness with which its details were worked out, the most important of theseries. It seems to me to furnish a conclusive argument—an argument fully sustained by all of the other gaugings—in favor of the safety of depending upon very small conduits for the removal of the dry-weather flow of sewage of cities and towns. It shows conclusively that the commission of the National Board of Health which recommended the system since carried out in Memphis—lateral sewers 6 inches in diameter, main outlet 20 inches in diameter—for a prospective population of 60,000, provided a wide margin for contingencies.

The result of these investigations cannot fail to be of the greatest practical value, especially in the case of the smaller towns, where the cost of constructing the usual storm-water systems is so great as to be prohibitory. Incidentally, the advantage to all towns, large or small, of adjusting the sizes of the sewers to the actual work of removing foul wastes must be regarded as most promising.

NOTE.—Robert Moore, esq., sewer commissioner of Saint Louis, has formulated a table based on the actual gaugings of the Compton avenue sewer (Saint Louis). He says, concerning it:

"When the water is running at the rate of 1,250 gallons per house per day, which, it is supposed, will never be exceeded, the depth of flow will be equal to three-quarters the diameter of the pipe.

"This rate is 23 per cent. greater than the *maximum* rate of the typical day in Compton avenue, and 60 per cent. greater than the average rate of the same day, and seems to me to be as great as need ever be counted on from house drainage alone."

It is at least four times as great as the usual consumption of water.

I have also received from him the results of the gaugings of the Ohio avenue sewer in Saint Louis.

The sewer is 7½ feet in diameter (necessarily very large, because of large amounts of storm water which it was constructed to remove). Its district contains 120 houses, with a population of 760. The *greatest* discharge of sewage from this population filled a 6-inch pipe *to a depth of only* 1½ *inches.*

THE INTERNATIONAL SANITARY CONGRESS AT TURIN.

The International Congress of Hygiene will meet at Turin September 6 and close September 12.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

MONTHLY REPORT OF MORTALITY IN CITIES OF THE UNITED STATES.

Cities and States.	Month.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Consumption.	Croup.	Diarrhœal diseases.	Diphtheria.	Enteric.	FEVER. NOTES.

New Haven, Conn.—For May the mean temperature was 64°.3; highest daily mean, 80°.7 on the 26th; lowest, 48°.7 on the 1st; mean daily range, 17°.8; clear days, 7; rain on 9 days; rainfall, 1.24 inches; mean humidity, 67.6. For June: mean temperature, 70°.5; highest daily mean, 82° on the 28th; lowest, 56° on the 2d; mean daily range, 18°.1; clear days, 4; rain on 9 days; rainfall, 1.21 inches; mean humidity, 68.3.

Burlington, Vt.—For May: Marriages, 9; births, 29; mean temperature, 61°.5; rainfall, 1.46 inches; mean humidity, 60.9.

Hudson County, N. J.—For May, 73 marriages and 186 births reported; annual birth-rate, 10.7 per 1,000; still-born, 24, or one to 7.7 births; 6 deaths are noted from sunstrokes, being the first time in six years that any have occurred from that cause in May; total from sunstroke in 1879 was 18. For June there were 110 marriages and 245 births reported; annual birth-rate, 14.0 per 1,000; still-births, 14, or 1 to 17.5 births. The death-rate in June increased 8 per 1,000 in Hoboken, 4 in Jersey City, and 2 in the county, as compared with the average of the last four years.

Vineland, N. J.—June: Dr. Brewer notes, in connection with the increase of diarrhœal diseases in man, the prevalence of cholera in domestic fowls. The symptoms in chickens were those of Asiatic cholera in man; the disease was widely spread, and evidently contagious among the fowls.

District of Columbia.—For May, of the 346 deaths, there were 164 white and 182 colored; annual rate per 1,000, white, 17.2; colored, 39.0; deaths under 1 year, 115, or 33.2 per cent. of all deaths; under 5 years, 46 per cent.; marriages reported, 73: white, 51; colored, 22; births reported, 297: white, 163; annual rate, 17.6 per 1,000; colored, 134; annual rate, 28.7 per 1,000; still-births, 31: white, 10, colored, 21; proportion of still-births to viable births, white 1 to 16.3, colored 1 to 6.4; mean temperature for the month, 70°.9; highest daily mean, 83°.5 on the 26th; lowest, 52°.7 on the 1st; highest noted, 96° on the 26th; lowest, 38° on the first; maximum daily range, 34°.5 on the 16th; minimum, 8°.5 on the 23d; mean daily range, 24°.9; clear days, 20; rain on 6 days; rainfall, 3.37 inches; prevailing winds, south.

Norfolk, Va.—For May the deaths were 41 white, annual rate, 33.0; colored, 42, annual rate, 44.6 per 1,000; of deaths under 5 years there were 22 white, rate 17.7, and 24 colored, rate 25.5 per 1,000; still-births, 3. For June the deaths were 30 white, rate, 24.1; colored, 50, rate, 53.1 per 1,000 per annum; deaths under 5 years: white, 16, annual rate, 12.9; colored, 26, annual rate, 27.6 per 1,000; still-births, 6: 1 white, 5 colored. Mean temperature for May, 73°.4; highest noted, 98°; lowest, 45; mean humidity, 65.9; rainfall, 0.54 inches; prevailing winds, southwest. For June: mean temperature, 76°.6; highest noted, 101°; lowest, 58°; mean humidity, 61.8; rainfall, 5.34 inches; prevailing winds, southwest.

Petersburg, Va.—Deaths, 57: white, 20, annual rate, 24.0;

colored, 37, annual rate, 37.0 per 1,000; deaths under 5 years: white, 9, annual rate, 10.8; colored, 22, annual rate, 22.0 per 1,000; marriages, 11: 4 white, 7 colored: still-births, 5: white, 1, colored, 4. For July, deaths, 97: white, 33, rate, 39.6; colored, 64, rate, 64.0 per 1,000: deaths under 5 years: white, 19, rate, 22.8; colored, 40, rate, 40.0 per 1,000: marriages, 9: white, 4, colored, 5; still-births, 3: white, 1, colored, 2.

JACKSONVILLE, FLA.—Total deaths for 6 months 106; annual rate 21.2 per 1,000. Of the decedents 37 were non-residents, of whom 33 were in advanced steps of consumption on arrival, and 4 had heart diseases; deducting these the rate for the city falls to 13.8. Mean temperatures for the 6 months, in order, 62°.1, 64°.3, 68°.3, 71°.9, 73°.9, and 81°.0; extremes for each month, 77–45, 81–42, 86–43, 91–42, 95–58, and 100–69. Total rainfall 21.77 inches; greatest, 6.17 in February and 6.24 in May; least, 1.69 in March and 1.50 in April. Frost was noted on one day of each of the first four months of the year.

PENSACOLA, FLA.—Of the 7 deaths there were 4 white and 3 colored; the relative populations are not given.

SELMA, ALA.—For May the deaths were 4 white, rate 15.6; 7 colored, rate 21.1 per 1,000 per annum; under 5 years, 4 white, 4 colored. For June, total deaths, 7 white, rate 27.2; 16 colored, rate 48.1: under 5 years 3 white, 8 colored. Births in May: 13, 4 white, 9 colored; in June: 15, 8 white, 7 colored.

NASHVILLE, TENN.—For May, deaths 74, white 40, rate 18.5; colored 34, rate 37.1 per 1,000. Still-births 3 white, 2 colored. Mean temperature 74°.2; highest daily mean 79°.7, on the 31st; lowest 57°.5, on the 1st. Mean humidity, 69.5; rainfall, 4.05 inches; clear days, 15; rain on 8 days; prevailing winds, south. For June, deaths 115, white 61, rate 28.1; colored 54, rate 58.9. Still-births 4 white, 5 colored. Mean temperature 77°.9; highest daily mean 87°.5 on the 14th; lowest 66°.2, on the 2d. Mean humidity, 61.1; rainfall 3.95 inches; clear days, 9; rain on 7 days; prevailing winds, south.

SHELBY COUNTY, TENN.—The population used in the table is that last given for Memphis. The reports for January and February will be found in No. 41 of the BULLETIN. For March, deaths 64; white 26, rate 18.7; colored 38, rate 32.7. Still-births, 4. April, deaths 85; white 40, rate 28.8; colored 45, rate 38.7. Still-births, 12. May, deaths 71; white 27, rate 19.4; colored 44, rate 37.8. Still-births 4. June, deaths 85; white 34, rate 24.4; colored 51, rate 43.9. Still-births, 8.

TOLEDO, OHIO.—Five still-births in May; not included with the deaths.

LANSING, MICH.—Two still-births in June.

CHICAGO, ILL.—For May the mean temperature was 64°.5; highest daily mean 76°.5 on the 7th; lowest, 49° on the 21st. Highest temperature noted 85, lowest 37. Clear days, 15; rain on 12 days; rainfall 4.97 inches; prevailing winds, southwest. For June, mean temperature 70°.2; highest daily mean 82°.7 on the 11th; lowest 56° on the 15th. Highest temperature noted, 91°; lowest, 52. Clear days, 8; rain on 13 days; rainfall 3.50 inches; prevailing winds, southwest.

MILWAUKEE, WIS.—Deaths in May, 184: still and premature births, 29. Mean temperature, 61°.5; highest daily mean 77°.2 on the 18th; lowest 48°.2 on the 21st. Highest temperature noted 86° on the 7th; lowest 39° on the 15th. Maximum daily range 33°; minimum 10°; mean 18°.9. Mean humidity 62.3; rainfall 3.13 inches; clear days, 8; rain on 16 days; frost on the 15th; prevailing winds, southwest.

RACINE, WIS.—One still-birth in May.

SAINT PAUL, MINN.—In April the mean temperature was 42°.5; highest noted, 79°; lowest, 22°; clear days, 8; rain on 11 days; rainfall, 1.58 inches. In May, mean temperature 63°.1; highest noted, 91°; lowest, 40°; clear days, 10; rain on 16 days; rainfall, 1.50 inches. In June, mean temperature, 68°; highest, 88°; lowest, 47°; clear days, 8; rain on 15 days; rainfall 5.55 inches; prevailing winds southeast for the 3 months.

KEOKUK, IOWA.—In May, 3 still-births are recorded. Mean temperature, 69°.6; highest noted, 88°; lowest, 47°; mean daily range, 18°.5; mean humidity, 60.1; rainfall, 5.92 inches. In June, mean temperature, 74°.7; highest noted, 91°; lowest 54°; mean daily range, 16°.8; mean humidity, 66; rainfall, 3.06 inches.

OAKLAND, CAL.—For May 63 births are reported, being at the annual rate of 17.8 per 1,000. Of 5,511 scholars in the public schools, 139, or 2.5 per cent., were reported sick during the month.

NOTES ON THE FEVER IN NEW YORK, 1802–1805.

The following memorandum on "the fever in New York" was written between the years 1802–1805 by Daniel L. Coit, esq., of Norwich, Conn., and is forwarded for publication by President D. C. Gilman of the Johns Hopkins University:

In the month of July, about the 17th, we had a spell of pretty warm weather in New York; the docks became offensive, and the one at Coffee House Slip the most so. Two vessels from Norwich, Capt. Richard Chappel and Capt. William Davison, were both lying in this dock. Captain Chappel came into it first, and after being there a few days sickened with the malignant fever. I saw him after he was taken sick. After remaining two or three days sick he obtained a pilot, and went home to New London, but died very soon after arriving there. His pilot, a Mr. Harris, likewise died. On board of Davison's vessel John Smith was taken sick, whom I likewise saw when quite ill; Davison himself complained before he went away. Smith died on arriving in New London, or before the vessel arrived; Davison survived a day or two and then died. A brother of Chappel's, in another vessel, likewise took the disorder and died, as did one or two others, and about the same time a young man who was in a store on Jones's Wharf. This was the first occasion of alarm in the city, and till these deaths happened, it was supposed the city was healthy as usual. Several cases soon after happened in the neighborhood, and two instances at Old Slip, where a daughter of Mr. Rappelie and after her his wife both died. Soon after this one or two cases happened in Garden street in the neighborhood of a privy which was said to be in a bad situation and very offensive. The disorder then seemed to be spreading up and down the streets from Coffee-House to Burling Slip and to Old Slip and up Wall street. Many of the inhabitants moved from this part of the town about the 8th of August, at which time I moved my books to the house. After this cases seemed to be spread more about the town; Greenwich street and all the lower parts of the cross streets from Liberty to Read, both inclusive, had cases in them—Liberty and Courtland some of the first. But many people having moved over to this part of the town, it is difficult to determine whether the disorder was brought from the east side or originated on the west; but the difference between the west side and Broadway was very manifest, for the instances in Broadway were rare, while on the west side they were much increased. About the 20th there were a number of cases near the Bear Market and farther up Greenwich street; Mr. Stag, in Greenwich, by the market, died about the 22d, and his son, in a very airy situation in Robinson street, on the 29th. He probably took the disorder on the west side attending his father, as he was extremely cautious and went but little about; he did not see his father after he died. About the 22d, 23d, and 24th there were, I think, three days very cool and something windy, which it appeared to me would be favorable to those who were in health, for I think it must have removed most of the stagnant air. I at the time thought there would be fewer new cases (at the proper time) in consequence, and it now seems to be the case, for on the 28th and 29th the new cases reported were but six or seven each day, which is less than half the number which happened a few days preceding. I write these memoranda, however, from memory on the 30th, and of course they are not perfectly accurate.

Some circumstances look like an importation of this disorder, and some like a generating cause here. The first deaths which happened were very near to two vessels which it was apprehended might have contained the disorder, and the situation of the air in the slips was in a proper situation to receive it. It seems that at first it was confined to Coffee-House Slip, when many other slips were in a situation nearly as bad, in which people slept as well as there, and had the disorder then existed there they must have taken it. On the other hand, why are the cases so much more numerous on the North River and streets running up from thence to Broadway, if it has not originated there likewise? for the inhabitants of Broadway have been as much about the east side as the inhabitants of those streets. In reply to this, however, it may be said the air was bad in those low places, and in a proper state to receive and hold the infection when brought over from the east side, and that, though brought over by a single person, or by a few, it might, from them, become impregnated with the poison, and communicate the disorder to many others, while the purity of the air in Broadway might be an objection to the reception and propagation of the contagion there. Physicians are generally of the opinion that its origin is generally here, though it may be imported, and many of the city at large are of opinion that it is exclusively imported. It is of importance that the truth should be known, for, if our air is incapable of generating the disorder, a greater quarantine regulation might be the means of keeping this deadly malady at a distance.

On the 7th September I removed with my family to Phillipsburg, and had not afterwards so favorable an opportunity to watch the progress of the disorder, but the longer its continuance the more generally it seemed to be spread about the town. Almost all the eastern and western parts of the town became infected, and, though a very considerable part of the inhabitants had moved out, the number of cases and deaths increased. Broadway, however, continued remarkably healthy, even to the present time, October 6, there not having been more than three or four deaths in the whole street, and these probably were not occasioned by the air of the street. Whatever the cause of this malady is, it seems that it does not contaminate air which is good, but that when brought within the sphere of bad air its operation is then to increase and extend itself, and I apprehend that like heaven, it ceases not to operate till the whole of such air is contaminated. Bad air seems to be the fuel of the poison, the spark which sets it in action, and converts the whole into a consuming fire.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

ABSTRACTS FROM CONSULAR REPORTS.

BAHIA, BRAZIL.—United States Consul R. A. Edes reports for five weeks ending June 5 but 4 deaths from yellow fever; these occurred at quarantine hospital in persons coming from Rio de Janeiro. The disease had not extended to the city. There were 405 deaths from all causes in 5 weeks, giving an annual rate of 31.3 per 1,000.

BOMBAY.—The report for the first three months of 1879 gives a total of 5,457 deaths, with an annual rate of 33.8 per 1,000. Among the causes of death were: Malarial fevers, 1,981; dysentery, 417; diarrhœa, 299; continued fever, 119; small-pox, 142; cholera, 45, and measles, 25. There were 3,149 births recorded, being at an annual rate of 19.5 per thousand of population. Mean temperature for January, 76°.3; February, 76°.2; March, 79°.5. The rainfall was almost nothing. Of 4,303 primary vaccinations, 3,557 were successful, 173 failures or doubtful, and 573 result unknown.

COLOGNE, GERMANY.—United States Consul George E. Bullock reports for the month of May, 8 deaths from measles, 10 from scarlet fever, 3 from diphtheria, and 3 from whooping-cough. There were 330 deaths from all causes, in a population of 141,640, being at the rate of 27.9 per 1,000 per annum.

DEMERARA.—United States Consul Philip Figyelmesy forwards the report of mortality in Georgetown for the month of May, 1880. In a population of 29,064 there were 161 deaths, being at the annual rate of 66.5 per 1,000. Among the causes of death were: Dysentery, 8; diarrhœa, 6; malarial fevers, 3; syphilis, 6; dropsy, 11; consumption, 26; diseases of brain and nervous system, 18; heart diseases, 9; acute lung diseases, 7; old age, 11; debility and marasmus, 12; accidents and injuries, 5. The births were 101, or at the annual rate of 41.7 per 1,000.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett, sending reports from Point-a-Pitre for the three weeks ending June 19, states that yellow fever is abating, and no deaths are reported since June 5; there were two deaths in the week ending at that date. The deaths from all causes for the 3 weeks were 29, giving an annual rate of about 22 per 1,000; this is not high, but the sanitary condition of the port is not regarded as satisfactory.

LEEDS, ENGLAND.—United States Consul A. V. Dockery forwards the report of the health officer for the week ending June 5. During the week there were 131 deaths, in a population of 318,930, being at the rate of 21.4 per 1,000 per annum. Of the decedents, 33 were under one year and 29 were over 60 years of age. Among the fatal cases were: Diphtheria, 3; diarrhœa, 3; typhoid fever, 2; measles, 1; scarlet fever, 1, and whooping-cough, 1.

LYONS, FRANCE.—United States Consul B. F. Peixotto reports for the week ending June 19, six deaths from small-pox, one from typhoid fever, and nine from other contagious diseases. There were 144 deaths from all causes, and it is noted that the death-rate of 21.8 per 1,000 per annum is the lowest that has been observed for several months; the annual average rate for the whole of France is stated to be higher than the above. During the month of May the rate was 27.7, the deaths being 792; in the same period there were 746 births, giving an annual rate of 26 per 1,000. There were 258 marriages, or 9 per 1,000 per annum, and the still-births were 42, or one in 18 of the total number of births.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports for the month ending June 15, a total of 351 deaths, in a population of 153,500, giving an annual rate of 27.4 per 1,000. Diseases of the heart caused 43 deaths, diarrhœal diseases, 51; consumption, 15; other lung diseases, 24; measles, 6; typhoid fever, 3; small-pox, 1; diseases of the brain and nervous system, 32; diseases of infancy, 66; old age, 14, and accidents, 4. Measles, which had been epidemic for several months, have nearly disappeared for want of material.

NASSAU, BAHAMAS.—The reports of United States Consul T. J. McLain for the three weeks ending June 5 represent the sanitary condition of the town as very good, and state that there is no yellow fever or other contagious disease at that date.

NASSAU, BAHAMAS.—Vice-Consul Samuel G. Sanders, under date of July 15, reports that a malignant fever, resembling yellow fever in its symptoms, has broken out in the island since July 5. During the week ending July 10 there were 9 cases, of which 8 were fatal. From that date to the 15th there were 12 cases, several of which were fatal. The disease is almost confined to children, but 3 adults have died of it. The symptoms, as described by the physicians of Nassau, are a very high fever, with violent pains in the head, stomach, back, and limbs. These symptoms are generally followed in 36 hours by black hemorrhagic vomiting, and death often occurs after 3 days of illness. The local government is making every effort to discover the cause of this outbreak, and all proper sanitary precautions are taken to prevent its increase. Clean bills of health are no longer issued to vessels bound for ports in the United States.

NEW ZEALAND.—The report of the registrar-general for the month of March shows a total of 215 deaths in a population of 130,225, being at the annual rate of 19.8 per thousand. The births in the same period were 189, or at the rate of 45 per 1,000 per annum. Of the decedents, 86 were under 1 year, 35 from 1 to 5 years, and 94 over 5 years of age.

In the four principal towns, with an aggregate population of 75,720, there were 125 deaths, being at the rate of 19.8 per 1,000 per annum. Of these deaths, consumption caused 7; other lung diseases, 7; heart diseases, 5; diseases of the brain and nervous system, 8; of the digestive organs, 7; diphtheria, 2; croup, 1; typhoid fever, 7; diarrhœa, 26; dysentery, 23; cancer, 3; debility and old age, 7; and accidents, 5. The mean temperature for the month was about 60°.

NINGPO, CHINA.—United States Consul E. C. Lord sends reports from May 8 to June 5, showing that the city is free from epidemics and diseases likely to be transported in ships. No statistics of mortality can be obtained; population estimated at 300,000.

PERNAMBUCO, BRAZIL.—United States Consul A. Cone sends reports for five weeks ending June 6, showing 7 deaths from yellow fever, 32 from small-pox, 8 from typhoid and 2 from typhus fever. There were 409 deaths from all causes, giving an annual rate of 33.7 per 1,000. The sanitary condition is rated good.

RIO DE JANEIRO, BRAZIL.—United States Consul Thomas Adamson reports as follows for the five weeks ending June 5: Deaths from yellow fever, 111; typhoid fever, 16; "pernicious" fever, 34; and consumption, 158. Deaths from all causes, 1,017, which gives an annual death rate of 32.1 per 1,000, the population being estimated at 330,000.

The report from the marine hospital at Jurajuba for the month of May shows 734 admitted, 173 died, 560 discharged, and 1 remaining. During the last week in May yellow fever was considered no longer epidemic at Rio, but was reported to have broken out at Vassouras, an inland town 150 miles distant, where it was said 11 out of the first 15 cases died.

SANTA CRUZ, PALMA, CANARY ISLANDS.—For the month of April United States Consul F. W. Lavers reports 12 deaths in a population of 6,070, being at an annual rate of 23.7 per 1,000. The causes of death are not stated. Mean temperature for the month, 67°.

ST. THOMAS, WEST INDIES.—United States Consul V. Thompson reports for the first two weeks of June 5 deaths from consumption, 2 from dysentery, and 2 from malarial fever. Total deaths, 18; population not given.

SHANGHAI, CHINA.—United States Consul O. N. Denny is unable to give any statistics of this city. During the three weeks ending June 5 no contagious disease had prevailed, excepting a very mild form of measles. Mean temperature, about 74°; population, 2,000.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

CAMDEN, NEW JERSEY.—Dr. A. Marcy reports, under date of July 27 that the outbreak of small-pox in that city has been mostly confined to one filthy district. The disease now shows a tendency to spread, but is not of a malignant type.

HAVANA, CUBA.—Advices to July 23 state that during the week ending on that day there were 61 deaths from yellow fever, a large proportion of which were among the citizens. The type of the disease for the last ten days has been milder than before. The Spanish brig *Pluton*, which sailed July 23 for New York, had some of her crew sick with yellow fever while at Havana, and as she discharged at a very foul wharf, she should be regarded as infected.

MASSILLON, OHIO.—Dr. A. W. Ridenour, under date of July 12, states that the prevailing diseases in that region are diarrhœa and malarial fevers.

MOBILE, ALA.—A dispatch from Dr. George A. Ketchum, president of the board of health, reports the arrival of the British bark R. W. Wood at quarantine, July 25, from Havana, with yellow fever on board. Of her crew of nine men, two had died, three are convalescent, and one is now sick at quarantine hospital. The vessel is 36 miles from the city, and all precautions are taken to isolate the sick.

The "Havana Weekly Report," of July 17, notes in the shipping list for July 13 the sailing of the British bark R. W. Wood, Willar, master, for Mobile.

The bill of health taken out by the said vessel is dated at Havana, July 10, and signed by U. S. Consul Henry C. Hall. This bill sets forth the following facts: The bark R. W. Wood, of 314 tons, cleared for Mobile on the above date; no medical officer on board; nine men in crew, and no passengers. Last from Georgetown, D. C., loaded with coal; left Havana without cargo, and with white stone ballast. The vessel was built in 1862, and was never in the West

Indies but twice before—once in Cardenas, in 1878, and last winter in Trinidad. She had then no sickness on board, and has had none during her present voyage; there is no proof that she ever had yellow fever or any other infectious disease on board. Sanitary condition good. Entered port (at Havana) June 19, and has been discharging cargo at a wharf at Regla, which place has been healthy this season, so far. Was thoroughly fumigated and washed with disinfectants July 9, the ballast being included in the operation. Crew all well, and none have been sick in this port. Sanitary condition of the harbor where the vessel lay believed to be good. For the week ending July 8, there were 71 deaths from yellow fever and 11 from small-pox in Havana. The vessel left "in free pratique for this port," which means that she had not been quarantined at Havana.

The quarantine report from Mobile, for the week ending July 27, notes under date of July 30, that the first mate of the bark R. W. Wood, who had been removed to quarantine hospital on the arrival of the vessel, died of yellow fever July 29.

NASHVILLE, TENN.—Dr. William M. Clark, secretary of the State board of health of Tennessee, states, in a communication of July 29, that scarlet fever prevails in an epidemic form in the city of Nashville. It is not malignant, however, and it is to be hoped that with the fine sanitary condition of the city it will be of short duration; otherwise the city is in an unusually healthful condition for this season of the year. West Tennessee has less sickness of every kind than for years. In Eastern Tennessee there are many cases of dysentery with typhoid tendencies, and it is almost, in some sections, particularly around Athens, epidemic in its character. Typhoid fever prevails to a considerable extent also in East Tennessee, confined as a rule to broken or hilly sections.

NEW ORLEANS, LA.—Advices to July 26 state that there have been four cases of yellow fever and three deaths among the crew of the bark Excelsior to date.

PHILADELPHIA, PA.—Dr. R. A. Cleemann makes the following report for the quarter ending June 30, 1880:

The second quarter of the year 1880 was unusually warm in Philadelphia, the mean temperature, calculated from the observations taken at the United States signal station in this city, having been 65° F., while the average for this quarter during the last nine years has been but 60.8° F. Each of its three months was warmer than common, but May was exceptionally hot, registering a mean temperature of 68.8° F., against a nine years' average of 61.9° F. The range of the thermometer was, however, also greater than usual, the lowest point to which the mercury fell in April being 29° F., while the highest attained was 96° F., in May—a difference of 67° F. In my opinion these variations are, from a hygienic point of view, conservative; the low temperatures offset beneficially the high ones; nevertheless the uncommon heat preponderated, and was accompanied, as will be seen below, by a marked rise in the death-rate.

The rainfall was much diminished, but 4.64 inches having been recorded, not quite half the average for this quarter during nine years. In this deficiency attention is again attracted especially by May, the whole rainfall of the month measuring but half an inch. The mean humidity of the atmosphere was rather less than the average for the whole quarter, having been marked 59.6 (saturation = 100) against 61.3; but in May this climatic feature did not differ from its average. Under the above meteorological conditions the whole number of deaths recorded during the quarter (April 4–July 3, thirteen weeks), exclusive of stillbirths (239) and those of children prematurely born (68), was 4,672, divided among the several months as follows: April (4 weeks), 1,354, May (4 weeks) 1,308, and June (5 weeks) 2,010. This mortality is equal to an annual death-rate of 22.05 (28.7) per thousand inhabitants living, making use of the figures given informally by the United States census officers, according to which the population of Philadelphia is counted 847,542 souls. While this is not intrinsically a high death-rate, it compares very unfavorably with the mortality in the corresponding period of the previous year, which was 3,617 deaths, or nearly a quarter less, equal to an annual death-rate of 17.3.

The second quarter in Philadelphia, with the exception of the fourth quarter, is, as a rule, the healthiest of the year, while the third quarter with its high temperature is accustomed to show the heaviest mortality. Is it to be wondered at then that the earlier summer heat in 1880 should be accompanied with an approach to the higher summer death-rate? In fact the mortality culminated in the last week credited to June, that ending July 3; for these seven days 608 deaths were recorded, a number nearly double that credited to any other week in the quarter. I have no doubt that part of this harvest of death had its seeds planted in the exceptionally warm weather in May.

Of those who died, 2,345 were males, and 2,327 females. Their ages were as follows: Under one year, 1,223; between one and two years, 368; between two and five years, 320; between five and ten years, 175; between ten and fifteen years, 67; between fifteen and twenty years, 126; between twenty and thirty years, 452; between thirty and forty years, 419; between forty and fifty years, 361; between fifty and sixty years, 327; between sixty and seventy years, 341; between seventy and eighty years, 305; and beyond eighty years, 188.

There appears in the distribution a much greater proportionate infantile mortality than is wont to be found at this season in Philadelphia. The cause is readily recognized in the large number of deaths recorded below under the headings cholera infantum, tabes mesenterica (marasmus), cephalitis, convulsions, debility, and inanition. That fell destroyer, heat, finds his easiest prey in the immature structures of the very young.

The following classification shows the number of deaths from each cause:

I. ZYMOTIC DISEASES 980, including *miasmatic diseases* 957 (small-pox, 21; measles, 42; scarlatina, 88; diphtheria, 72; croup, 62; whooping cough, 26; typhoid fever, 82; typhus fever, 5; erysipelas, 18; puerperal fever, 10; dysentery, 19; diarrhœa, 30; cholera infantum, 349; cholera morbus, 22; malarial fevers, 6; rheumatism, 24; cerebro-spinal meningitis, 27; other miasmatic diseases, 54); *cuthetic diseases*, 2; *dictic diseases*, 18; *parasitic diseases*, 3.

II. CONSTITUTIONAL DISEASES 1,087, including *diathetic diseases* 169 (cancer, 105; other diathetic diseases, 64); *tubercular diseases*, 918 (tabes mesenterica, 198; phthisis pulmonalis, 667; other tubercular diseases, 53).

III. LOCAL DISEASES 1,924, including *diseases of the nervous system* 754 (cephalitis, 259; apoplexy, 68; paralysis, 93; convulsions, 229; sunstroke, 23; other diseases of the nervous system, 82); *diseases of the organs of circulation*, 207 (pericarditis, 33; aneurism, 8; heart diseases, 164; other diseases of the organs of circulation, 2); *diseases of the respiratory organs*, 491 (bronchitis, 99; pleurisy, 16; pneumonia, 320; other diseases of the respiratory system, 56); *diseases of the digestive organs*, 319 (enteritis, 131; peritonitis, 62; intestine diseases, 29; stomach diseases, 5; liver diseases, 78; other diseases of the digestive organs, 14); *diseases of the urinary organs*, 122 (nephritis, 14; Bright's disease, 74; other diseases of the urinary organs, 34); *diseases of the generative organs*, 20 (diseases of the ovaries, 11; uterus diseases, 9); *diseases of the organs of locomotion*, 9 (caries and necrosis, 8; joint diseases, 1); *diseases of the integumentary system*, 2.

IV. DEVELOPMENTAL DISEASES 493, including *developmental diseases of children* 40 (malformations, 33; teething, 7); *developmental diseases of adults*, 9 (childbirth, 3; puerperal convulsions, 2); other developmental diseases of adults, 4); *developmental diseases of old people*, 191 (old age, 191); *diseases of nutrition*, 253 (debility, 146; inanition, 107).

V. VIOLENT DEATHS, including *accident or negligence*, 154 (drowning, 44; otherwise, 110); *homicide*, 6; *suicide*, 25.

CAUSES NOT SPECIFIED, 3. Total, 4,672.

In comparison with the mortality of the previous quarter, that for the last three months shows an increase in every one of the above classes of disease, but by far the greatest excess is found in that of zymotic diseases. The large increment is due for the most part to the great number of deaths from cholera infantum, for almost all the other more prominent zymotics declined in their death-rate, the important exception being scarlatina.

The 88 deaths from the latter disease exceeded those in the previous quarter by 35, and though the whole number is not large among so great a population as ours, and the deaths were well scattered throughout the city, yet the higher figures have a certain significance in that up to the end of the previous year the disease had been declining, while there had been no marked increase in its mortality during the first quarter. However, this is not the season of the year when scarlatina is prone to become prevalent in Philadelphia, so that I do not expect a very decided increase in the number of deaths till at least the last quarter of the year.

The deaths from small-pox fell off one-third from their number in the previous quarter, justifying the opinion expressed in a former letter of the comparative insignificance of the present invasion of the disease. Measles, as anticipated, kept up its death-rate during April, but declined rapidly in May and June. Diphtheria and croup had a much lessened mortality as usual at this season, while typhoid fever, notwithstanding the mild winter, hot May, and prolonged drought, which I should have expected to determine a higher death-rate, was responsible for less than its average number of deaths at this time of the year. The confidence expressed that typhus fever would not fix its hold upon the community is seen to have been not misplaced, since only five deaths from it are reported, and of these four are credited to April, one to May, and none at all to June.

Of the 349 deaths recorded from cholera infantum, 328 were returned for June, and of these, 186 for the last week of the quarter, that ending July 3. The mortality, though above the average for this disease in the second quarter during several years past—years in which the deaths from cholera infantum have been diminishing in Philadelphia—is yet not exceptional. As we have seen above that the summer has been premature this year, bringing to us its mortality before the time, it is quite possible that the hot season may end sooner, so that the third-quarter will have a lessened death-rate, in comparison with its average, from this disease, and the whole summer, the mortality of which is gauged by the prevalence of cholera infantum, will not be behind those of other years in healthfulness.

Our board of health has for several summers been distributing among the masses a printed list of rules prepared by the Obstetrical

Society of Philadelphia, which gives specific, though brief, directions for the management of young children in warm weather, with reference to bathing, clothing, feeding, and the general preservation of favorable hygienic surroundings. Parents accept these rules with great eagerness, and I cannot doubt but that the instruction gained from them has saved many lives. The advantages of the smaller "squares" and the large park at Fairmount in counteracting the effects of the summer heat are duly appreciated, but benevolent citizens have established a "sanitarium" on an island in the Delaware River, immediately opposite the city, whither a steamboat carries free of charge all mothers with their children, sick or well, who wish to seek its benefits. There, away from the heated city, refreshed by the cooling breezes and a dip in the water, the little ones and their protectors may remain the whole day long; food is given them and even medical attendance is at hand, should occasion require the intervention of a physician.

The deaths registered from dysentery, diarrhœa, and cholera morbus, though really insignificant in number, increased, as usual, over the mortality from these diseases in the colder first quarter.

The whole number of deaths from "local diseases" is not very much in excess of that for the previous quarter, but this is because the diminished mortality from diseases of the respiratory system, apparent in this quarter, goes towards balancing the increased number of deaths from diseases of the nervous system, especially cephalitis, convulsions, and sunstroke, and those from diseases of the digestive organs, notably enteritis and liver diseases.

It is remarkable to have as many as 23 deaths from sunstroke at so early a period of the year, and, indeed, extraordinary to have any at all in May, which has furnished this year 5. I need not again refer to the premature heat in this connection.

For a long time the board of health had been urging an appropriation for constructing floating bath-houses which should be free to the public, and which could be so conveniently located along the banks of our rivers. These have now been built, and, moored to the wharves, are sought by thousands of men and boys, and, at certain hours reserved to them, by women and girls also, who thus have within their reach a most precious and agreeable means of preserving health during the warm weather.

PERU, IND.—P. Zimmerman, secretary of the local board of health, sends a report of mortality for the three months ending June 30, 1880. Twenty-nine deaths and 1 still-birth are recorded. Consumption caused 5 deaths, other lung diseases 6, diphtheria 1, paralysis 1, heart disease 1, peritonitis 1, puerperal fever 1, nephritis 1, old age 1, and accident 1. There were 9 deaths under 5 years, and 1 over 90 years of age. The population is not stated.

YOKOHAMA, JAPAN.—Dr. T. H. Streets, U. S. N., under date of July 9, writes as follows:

The health of Yokohama continues good, although cases of choleraic diarrhœa are reported. These, however, have nothing of an epidemic character, and are believed by the best informed foreign physicians of Yokohama to be due to the habit of the Japanese of eating unripe fruit.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

NOTE.—Boston has 370,000 white, 5,000 colored; deaths, 188 white, 4 colored. Rate per 1,000, white 26.5, colored 41.7. Providence has 100,862 white, 4,000 colored; deaths, 38 white, 4 colored. Rate per 1,000, white 19.6, colored 26.1. Sing Sing has 7,250 white, 250 colored; deaths, 8 white, 1 colored. Rate per 1,000, white 57.5, colored 208.7. Wilmington, Del., has 38,000 white, 6,000 colored; deaths, 14 white, 1 colored. Rate per 1,000, white 15.5, colored 8.7. Baltimore has 338,384 white, 55,412 colored; deaths, 114 white, 38 colored. Rate per 1,000, white 17.5, colored 35.7. District of Columbia has 114,000 white, 56,000 colored; deaths, 36 white, 37 colored. Rate per 1,000, white 16.5, colored 34.4. Norfolk has 14,900 white, 11,300 colored; deaths, 5 white, 15 colored. Rate per 1,000, white 17.5, colored 52.5. Lynchburgh has 10,000 white, 11,000 colored; deaths, 1 white, 6 colored. Rate per 1,000, white 5.2, colored 28.4. Wilmington, N. C., has 6,714 white, 10,286 colored; deaths, 1 white, 8 colored. Rate per 1,000, white 7.7, colored 40.6. Charleston has 25,000 white, 32,000 colored; deaths, 8 white, 22 colored. Rate per 1,000, white 16.6, colored 35.7. Savannah has 18,229 white, 15,019 colored; deaths, 8 white, 9 colored. Rate per 1,000, white 22.8, colored 31.2. Augusta has 16,176 white, 10,824 colored; deaths, 6 white, 7 colored. Rate per 1,000, white, 19.4, colored 32.8. Atlanta has 25,373 white, 16,175 colored; deaths, 2 white, 7 colored. Rate per 1,000, white 4.4, colored 22.5. Mobile has 28,000 white, 12,000 colored; deaths, 2 white, 10 colored. Rate per 1,000, white 3.7, colored 43.5. Selma has 3,425 white, 4,080 colored; deaths, 1 white, 5 colored. Rate per 1,000, white 15.2, colored 63.9. Jacksonville, Fla., has 6,000 white, 4,000 colored; deaths, 4 white, 2 colored. Rate per 1,000, white 34.8, colored 26.1. Columbus, Miss., has 3,500 white, 2,547 colored; deaths, white 2, colored none. Rate in table. New Orleans has 155,000 white, 55,000 colored; deaths, 60 white, 33 colored. Rate per 1,000, white 20.2, colored 31.3. Shreveport has 3,716 white, 4,217 colored; deaths, 2 white, colored none. Rate in table. Nashville has 27,874 white, 15,669 colored; deaths, 20 white, 10 colored. Rate per 1,000, white 23.0, colored 33.6. Clarksville has 4,000 white, 3,250 colored; deaths, 1 white, 2 colored. Rate per 1,000, white 13.0, colored 32.0. Chattanooga has 8,000 white, 5,000 colored; deaths, 2 white, 2 colored. Rate per 1,000, white 13.0, colored 20.9. Louisville has 153,125 white, 21,875 colored; deaths, 27 white, 10 colored. Rate per 1,000, white 9.2, colored 24.5. Keokuk has 15,000 white, 800 colored; deaths, 3 white, 5 colored. Rate per 1,000, white 19.3, colored 326.1. Total white population, 1,492,528; deaths, 553; annual rate per 1,000, 19.3. Total colored population, 361,704; deaths, 236; annual rate per 1,000, 34.3.

The following reports for the week ending July 10 are from places in which burial permits are required, and having less than 5,000 population:

Bridgewater, Mass., 4,000; deaths, 1. Cambridge, N. Y., 1,850; deaths, 1; diptheria, 1. Edgartown, Mass., 1,400; no deaths. Fairfield, Conn., 3,700; no deaths. Franklin, Ind., 4,000; deaths, 3. Morgan City, La., 2,018; deaths, 1; diarrhœa 1. Murfreesborough, Tenn., 3,800; deaths, 3; under 5 years, 1; enteric fever, 1. Shelbyville, Tenn., 1,913; no deaths. Saint Augustine, Fla., 2,500; deaths, 2; under 5 years, 1, diarrhœa, 1. Total population, 25,181; deaths under 5 years, 2; total deaths, 11; annual rate per 1,000, 22.8.

The following reports for the week ending July 24 are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 12; under 5 years, 5; consumption 3, diphtheria 4, lung diseases 1. Allegheny, Pa., 78,000; deaths, 14; under 5 years, 12; consumption 2, diarrhœa 8, scarlet fever 1. Bath, Me., 10,000; deaths, 5; diarrhœa 1. Battle Creek, Mich., 7,500; deaths, 1. Belfast, Me., 5,278; deaths, 2; malarial fever 1. Boulder, Colo., 3,030; deaths, 2; under 5 years, 2; diarrhœa 2. Brattleborough, Vt., 6,000; no deaths. Calais, Me., 6,162; deaths, 3; consumption 1. Carrollton, Miss., 600; deaths, 1; diarrhœa 1. Chillicothe, Ohio, 11,000; no deaths. Circleville, Ohio, 6,400; deaths, 1; under 5 years, 1. Clinton, Mich., 1,205; no deaths. Columbus, Ga., 10,137; deaths, 3; under 5 years, 1; diarrhœa 1. Corinth, Miss., 2,264; deaths, 3; under 5 years, 2; diarrhœa 1, whooping cough 1. Cumberland, Md., 12,000; deaths, 6; under 5 years, 4; consumption 1, scarlet fever 1. Dallas, Tex., 10,300; deaths, 4; under 5 years, 3; puerperal 1. Davenport, Iowa, 23,000; deaths, 12; under 5 years, 8; consumption 1, diarrhœa 4, diphtheria 3, malarial fever 1, scarlet fever 2. Decatur, Miss., 1,000; deaths, 1; lung diseases 1. Fayette, Miss., 400; no deaths. Fernandina, Fla., 3,000; deaths, 1. Flint, Mich., 9,000; deaths, 3; under 5 years, 1; diphtheria 1, malarial fever 1. Franklin, Tenn., 1,633; deaths, 1. Gunn City, Mo., 125; deaths, 2. Helena, Mont., 3,625; deaths, 1. Huntingdon, Pa., 4,500; deaths, 1; diarrhœa 1. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; deaths, 1; under 5 years, 1. Jefferson, Tex., 3,251; deaths 3; under 5 years, 2; malarial fever 1. Kenosha, Wis., 5,500; deaths, 2; consumption 1. Key West, Fla., 1,500; deaths, 6; under 5 years, 4; diarrhœa 2, puerperal 1. La Salle, Ills., 10,000; deaths, 3; under 5 years, 2; diarrhœa 2. Lebanon, Pa., 9,000; deaths, 3; enteric fever 1, lung diseases 2. Louisiana, Mo., 5,200; deaths, 3; enteric fever, 1. Madison, Ind., 9,009; deaths, 6; under 5 years, 4; consumption 1, scarlet fever 2. Martinsburg, W. Va., 6,584; deaths, 2; diarrhœa 1. Meridian, Miss., 4,013; deaths, 5; under 5 years, 2; diarrhœa 2. Milledgeville, Ga., 4,000; no deaths. Montgomery, Ala., 17,000; deaths, 2; consumption 1, whooping-cough 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; deaths, 1. Muscatine, Iowa, 8,412; deaths, 8; under 5 years, 5; consumption 1, diarrhœa 3, scarlet fever 1, lung disease 1. Muskegon, Mich., 11,300; deaths, 8; under 5 years, 6; consumption 1, diarrhœa 4, accident 1. Niles, Mich., 1,000; deaths, 2. Ocala, Fla., 1,000; no deaths. Okolona, Miss., 1,900; no deaths. Oshkosh, Wis., 18,030; deaths, 2; under 5 years, 1; diarrhœa 1. Painesville, Ohio, 5,000; deaths, 1; under 5 years, 1; diarrhœa 1. Pass Christian, Miss., 4,000; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; deaths, 1. Portsmouth, Ohio, 11,320; deaths, 6; under 5 years, 2; consumption 2, diarrhœa 1, accidents 2. Ripley, Miss., 1,000; no deaths. Rock Island, Ill., 12,000; deaths, 5; under 5 years, 2; malarial fever 1, puerperal 1, diarrhœa 1. Rockland, Me., 7,500; deaths, 2. Santa Cruz, 5,000; no deaths. Springfield, Ohio, 21,000; deaths, 8; under 5 years, 1; consumption 2, scarlet fever 1, accident 1. Starkville, Miss., 1,454; deaths, 1; under 5 years, 1; diarrhœa 1. Steubenville, Ohio, 13,500; deaths, 1. Tampa, Fla., 1,200; no deaths. Titusville, Pa., 9,000; deaths, 1. Tuskaloosa, Ala., 2,000; deaths, 1. Winchester, Va., 5,000; deaths, 2; under 5 years, 2; diarrhœa 1, scarlet fever 1. Winona, Minn., 10,000; deaths, 3; under 5 years, 3; croup 1, diarrhœa 1, measles 1. Youngstown, Ohio, 15,327; deaths, 7; under 5 years, 3; consumption 1, diarrhœa 2, lung diseases 1. Total population, 485,097; deaths under 5 years, 81; total deaths, 175; annual rate per 1,000, 18.8.

LATEST ADVICES CONCERNING YELLOW FEVER.

HAVANA, CUBA.—Week ending July 24, deaths from yellow fever, 59, small-pox 7, typhoid fever 3. Probably 200 cases of yellow fever in the city at this date. Week ending July 31, deaths from yellow fever 51, small-pox 18. The following vessels are believed to have had yellow fever on board while at Havana: Spanish bark *Cisneros*, for New York, July 26; American bark *U. H. Hopkins*, for northeastern coast of United States *via* Matanzas, July 28; Spanish bark *XII de Junio*, for Charleston, S. C., July 29; Spanish brig *Cid*, for New York, July 30.

RIO DE JANEIRO.—July 3, deaths from yellow fever 7; total deaths 183; July 10, deaths from Yellow fever 5; total deaths 180.

GUADALOUPE.—July 10, at Pointe à Pitre 3 deaths from yellow fever; 15 from all causes. The people, and especially the merchants, keep the mortality from yellow fever as secret as possible.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, AUGUST 14, 1880. [No. 7.

THE INTERNATIONAL SANITARY CONFERENCE.

The honorable Secretary of State transmits, in a communication to Dr. J. L. Cabell, the president of the National Board of Health, the following circulars to the ministers representing the United States at the capitals of the several maritime powers of the world, inviting those powers to send delegates to an international sanitary conference to be held in Washington, January 1, 1881:

DEPARTMENT OF STATE,
Washington, July 20, 1880.

SIR: I have to state for your information that in pursuance of a joint resolution of Congress, which was approved on the 14th of May last, the President has determined to call an international sanitary conference to meet at Washington, and to invite to join in the proposed conference the several powers having jurisdiction of ports likely to be infected with yellow fever or cholera, with a view of securing the adoption by the powers in question of an international system of notification as to the actual sanitary condition of ports and places under the jurisdiction of such powers, and of vessels sailing therefrom.

I inclose herewith a memorandum in which the circumstances which have induced this government to ask those of other nations to join in the proposed international sanitary conference are set forth, and which concludes with a statement of the specific propositions which the President would desire to submit to the conference.

In view of the urgent necessity which, according to the experience of this government, exists for prompt action in reference to this matter, I have to instruct you to lose no time in calling the attention of the government of to this subject, by transmitting for its information a copy of the memorandum above mentioned, and by asking it at the same time to take into consideration the expediency of holding a conference of the character proposed, and requesting it to communicate its views on the subject to this government at as early a date as may be convenient.

You may add that it is thought by the President that such delegates as may be appointed by the several powers to attend the proposed conference should be authorized to conclude, if deemed expedient upon consultation, an international convention, in relation to any proper subjects for international sanitary regulations to be proposed for the consideration of the governments interested.

In order that the proposed conference, if agreed to by the several foreign governments interested in the subject, may be held at as early a period as practicable, the President deems it expedient to suggest the first day of January, 1881, as a suitable date for the assembling of the conference in the city of Washington. In the event, however, that the government of should have occasion to prefer a different date for the meeting of the conference, this government will be ready to reconsider the question with a view to an alteration in the date.

I am, sir, your obedient servant,

WM. M. EVARTS.

MEMORANDUM IN RELATION TO POINTS PROPOSED TO BE SUBMITTED TO AN INTERNATIONAL SANITARY CONFERENCE.

DEPARTMENT OF STATE,
Washington, July 29, 1880.

A joint resolution of the Senate and House of Representatives of the United States, approved May 14, 1880, authorized the President "to call an international sanitary conference to meet at Washington, District of Columbia, to which the several powers having jurisdiction of ports likely to be infected with yellow fever or cholera shall be invited to send delegates, properly authorized, for the purpose of securing an international system of notification as to the actual sanitary condition of ports and places under the jurisdiction of such powers, and of vessels sailing therefrom."

This resolution has its origin in the practical difficulties which have been encountered in the administration of the regulations and rules recommended by sanitary experience, and framed by the legislation of the country, to the end of preventing the introduction and spread of yellow fever, cholera, and other contagious or infectious diseases in the territory of the United States. The extensive prevalence of yellow fever in certain parts of this country during the past two years, and the almost continual existence of the danger of the introduction of such contagious or infectious diseases as yellow fever and cholera by vessels coming to this country from infected ports abroad, gave rise to such legislative measures, but the difficulty in their application has been chiefly owing to the fact that in certain foreign ports where infectious or contagious diseases have existed, or were supposed to exist, the local authorities have shown some hesitation as to co-operating with the consular and medical officers of the United States in carrying out regulations deemed essential by this government as a sanitary safeguard.

Moreover, in consequence of the vague and untrustworthy evidence obtainable in some cases as to the sanitary condition of suspected foreign ports, vessels coming thence to the United States have in some instances, as it has afterwards appeared, been subjected to unnecessary quarantine in the ports of this country. On the other hand, vessels from non-infected ports of the United States have been compelled to submit to like unnecessary and vexatious delays by the quarantine regulations of other countries, based upon imperfect knowledge of the sanitary condition of American ports.

The joint resolution of Congress quoted above contemplates only securing "an international system of notification as to the actual sanitary condition of ports and places," and does not touch on the broader and more intricate question of the preventive sanitary measures imposed in the ports of each country, in conformity with its own laws, and in proportion to the danger of outward communication and internal spread of epidemic disease at the port of introduction. The Government of the United States, recognizing the essentially local character of quarantine requirements, and their adaptability to the sanitary conditions and risks in the districts where they are applied, would not seek to propose any international code of general quarantine laws, even did the system of State and Federal Governments in the United States favor bringing the sanitary precautions of the seaboard States from Texas to Maine, with all their varying conditions, under one governmental code.

But the President is of the opinion that the great inconveniences and losses which the commerce of the world has been and is now suffering from the delays and obstructions caused by unnecessary quarantines can, to a great extent, be relieved by the establishment, as contemplated by the Congressional joint resolution of May 14, 1880, of an international system of notification as to the actual sanitary condition of ports and places likely to be infected with communicable or epidemic diseases. And following the authorization of the resolution referred to, he has, therefore, deemed it proper to submit to the governments of the chief maritime powers the expediency of holding a conference at an early day in this city to consider the subject of a proper and applicable scheme of such international notification.

The specific propositions which the President would desire to submit to the proposed conference would include the following:

A. The establishment of a reliable and satisfactory international system of notification as to the existence of contagious and infectious diseases, more especially cholera and yellow fever.

B. The establishment of a uniform and satisfactory system of bills of health, the statements in which shall be trustworthy as to the sanitary condition of the port of departure and as to the condition of the vessel at the time of sailing.

The discussion of these points would involve, among others, the following questions:

I. Who should be the certifying officer or authority as to the sanitary condition of ports and places and of vessels?

II. How can the certifying authority obtain trustworthy information as to the actual sanitary condition of ports and places and as to the presence of contagious and infectious diseases?

III. When yellow fever or cholera exists at or in the vicinity of a port or place, what examination should be made of a vessel sailing therefrom to secure a trustworthy knowledge of her sanitary condition?

IV. To what extent, and under what conditions, should a clean bill of health be considered as affording satisfactory evidence that the vessel is free from danger of conveying infectious disease?

V. In what way can trustworthy information be obtained from ports or places in countries which have imperfect or unsafe quarantine and sanitary regulations, and which may be unwilling or unable to adhere to the proposed international system?

VI. Whether a schedule of graduated penalties could be fixed to be exacted from vessels for various offenses arising under the proposed international system?

MONTHLY REVIEW OF MORTALITY FOR JUNE, 1880.

The absence of reports from several cities has reduced the mean population for this month to 8,130,174, which is 96,133 less than that for May, and about the same as that for April. The reports of mortality for April may therefore be compared directly with those for June. It will be observed that the early and excessive mortality from heat diseases has not greatly affected the general death-rate, which has advanced from 20.22 in April to 20.24 in May, and 22.05 in June. This is due to the fact that the increase in deaths from heat diseases has been largely compensated by a reduction in pulmonary and zymotic diseases, as will appear from the following table and analysis:

TABLE OF PRINCIPAL CAUSES OF DEATH.

Week ending—	Population.	Total deaths.	Annual rate per 1,000.	Deaths under 5 years.	Annual rate per 1,000.	Per cent. of deaths.	Consumption and lung diseases.			Consumption.			Lung diseases, acute.			Diphtheria and croup.			Diphtheria.

Causes of death.—The reduction of the death-rate from pulmonary diseases has been from 5.34 to 4.16 per 1,000 since May, or 22.1 per cent., and, as observed last month, the decline in acute lung diseases was more than that for consumption; in June the latter disease shows a rate of 7.5 per cent. lower than in May, while other lung diseases have fallen 37.5 per cent. The difference in the rate of reduction is probably due to the exhausting effects of continued heat upon persons advanced in phthisis, partly balancing the otherwise favorable influences of the season. Diphtheria and croup show an equal reduction of rate, being 4 per 1,000 less than last month for each disease. Scarlet fever still shows a decreasing death-rate, having fallen from 0.48 to 0.43, or 10.4 per cent., since May, and 17.3 per cent. since April. Measles, which last month had increased about 5 per cent. as compared with April, now show a sudden reduction from 0.46 to 0.29 per 1,000, or nearly 37 per cent. Enteric fever was noted last month as having declined 17 per cent.; the reports for June show a further reduction of 6.9 per cent. since May. Malarial fever[8] and whooping-cough have been so balanced in gain and loss in different parts of the country, that their general rate of mortality remains unchanged. Reference to the mortality from diarrhœal diseases for the successive weeks will show how rapidly the rate has advanced from 1.74 per 1,000 at the end of May, to 7.92 for the last week in June. Last year these diseases reached their highest death-rate, of 7 per 1,000, during the second week of July, which is usually the culminating point of heat diseases. In 1879, the reports for the last week in May gave a death-rate of 0.67 per 1,000 for diarrhœal diseases, so that the total number of deaths from heat diseases, which have begun so early this year, will probably far exceed the mortality of last summer. The deaths from diarrhœal diseases in June were equal in number to those from consumption and acute lung diseases combined, the mean rate being 4.16 per 1,000 for each.

Distribution of diseases.—In all three sections of the country consumption and acute lung diseases show a great reduction since May; in the Northeast, from 6.26 to 4.74 per 1,000, or 24.3 per cent.; in the Northwest, from 3.59 to 2.67, or 25.6 per cent.; and in the Southeast, from 5.32 to 4.64, or 12.8 per cent. But while consumption has been reduced nearly 9 per cent. in the Northeast and 11.6 per cent. in the Southeast, the rate has remained unchanged in the Northwest section. The mortality from acute lung diseases shows a great

decline since May; in the Northeast of 40, in the Northwest of 45.6, and in the Southeast of 15.2 per cent. Diphtheria has decreased nearly 16 per cent. in the Northeast, but is increasing in the other sections, having risen 6 per cent. in the Northwest and nearly 30 per cent. in the Southeast. Croup shows a reduction of nearly 12 per cent. in the Northeast, of 18.5 in the Northwest, and 25 per cent. in the Southeast, since May. Scarlet fever and measles have run nearly the same course since last summer. Both diseases were epidemic in some of the chief cities of the Northeast last year, then spread to the cities of the Northwest, and finally to those of the Southeast section. But, while measles are now on the wane throughout the country, scarlet-fever has declined only in the Northeast, advancing 5 per cent. in the Northwest, and 50 per cent. in the Southeast, which was the last section invaded by the disease. Enteric fever, which had abated in the Northeast last month, shows a further decrease in that section from 0.31 to 0.22, or nearly 30 per cent. In the Northwest the rate has advanced 18 per cent. and in the Southeast about 10 per cent. It was noted last month that whooping-cough had increased its death-rate by 9 per cent. in the Southeast, while the mortality was decreasing in the other sections. In June the rate has fallen 17 per cent. in the Northeast and 10 per cent. in the Northwest, but has advanced 20 per cent. in the Southeast. This indicates that whooping-cough, like scarlet-fever, diphtheria, and measles, has comparatively exhausted the available material for its extension in the higher latitudes, and shows an advance only in the field of latest invasion, where the climate and season would otherwise oppose its progress. Malarial fevers are now rife in the Southern part of the country, and will probably increase in fatality until October; an advance of 55 per cent. is noted since May for the Southeast section, while the rate has decreased 15 per cent. in the Northeast and 32 per cent. in the Northwest. It was observed early in this year that scarlet-fever found by far the larger portion of its victims in New England, Ohio, and Illinois, and, as it declined in those regions, spread over other parts of the country. On examining the increase of this disease in the Southeast section it appears that the city of Baltimore furnishes 29 out of the 50 deaths, or 58 per cent., while the population of that city is only 29 per cent. of the total included in the Southeast division. The mortality from diphtheria in Baltimore is also in excess of the ratio of population, showing 13 out of 36 deaths, or 36 per cent. Diphtheria also prevails in New Orleans to a greater extent than the relative population would allow; the population being only 15 per cent. of the total for the Southeast section, the deaths from diphtheria in June were 10 out of 36, or 28 per cent. of the whole mortality from that disease in the Southeast section. Measles exhibit a still greater relative mortality in New Orleans, the deaths being 23 out of a total of 38, or 61 per cent. Six months ago the mortality from this disease was almost confined to the cities of New York, Brooklyn, and Chicago, which for several weeks reported from 70 to 90 per cent. of the total mortality from measles. It is to be observed that, when such limitation of any disease to a few cities exists, the absence of a weekly report from a single city may produce a great but fallacious reduction in the general death-rate from the disease in question. In such cases the subtraction of the population of the missing city from the total does not preserve the balance, since the death-rate from the particular epidemic disease may be out of all proportion to the population. In estimating the value or significance of fluctuations in the general death-rate of any disease, this source of error, arising from irregular distribution of diseases and irregular reports from cities, is not to be overlooked. Up to the end of June there has been no report of vessels detained at quarantine stations on account of yellow-fever infection, though the disease prevails in Havana and Rio de Janeiro and has been reported at Nassau.

COLOR-BLINDNESS IN RAILROAD EMPLOYÉS.

The State of Connecticut has passed the following act directing the examination of railroad employés for color-blindness and defects of vision:

Be it enacted by the senate and house of representatives, in general assembly convened:

SECTION 1. The State board of health shall prepare rules and regulations for the examination and re-examination of railroad employés in regard to color-blindness and visual power, prescribing the method in which, and the intervals at which, such examinations shall be made, the maximum fee to be charged for each examination, the form of certificate to be issued by the examiners, and such other regulations as said board may deem necessary. Said board shall send a copy of such rules and regulations to every railroad company and trustee operating a railroad in this State, on or before the first day of July, 1880. Said board may from time to time make such changes in said rules and regulations as they may deem best, and communicate the same to said companies and trustees. Said board shall annually, in the month of May, recommend two or more medical experts to make the examinations above referred to, and the governor shall annually, on or before the first day of July, appoint not less than two medical experts, any one of whom shall be authorized to conduct the examination for color-blindness and visual powers, and issue certificates in accordance with the rules of the board of health.

SEC. 2. On or before the first day of October, 1880, every railroad company and trustee operating any railroad in this State shall cause every person in their employ as locomotive engineer or fireman, train conductor or brakeman, station agent, switchman, flagman, gate-tender, or signalman, to be examined at the expense of the railroad company by one of the examiners, to be appointed by the governor, in regard to color-blindness and visual power, and shall cause a like examination to be made of all persons employed after said date in either of the capacities named above, and shall cause re-examinations to be made in accordance with the rules prescribed by the board of health.

SEC. 3. Any railroad company or trustee operating any railroad in this State employing, after the first day of October next, in any of the capacities specified in the second section of this act, any person who does not possess a certificate of freedom from color-blindness and possession of normal visual power, duly issued in accordance with the provisions of this act, or knowingly employing in any of such capacities any person whose certificate has been revoked by the examiners, shall for each and every offense be punished by a fine of not less than two hundred nor more than one thousand dollars.

Approved March 25, 1880.

RULES FOR EXAMINATION OF RAILROAD EMPLOYÉS UNDER PRECEDING ACT.

Rule I.

All railroad employés requiring examination under the law of March 25, 1880, shall be divided into two general classes.

Class first shall include engineers, firemen, and brakemen.

Class second shall include train conductors, station agents, switchmen, flagmen, gate-tenders, and signalmen.

Rule II.

Certificates shall be given for each position in accordance with the succeeding rules for examination. Promotion from one class to the other requires re-examination and certificate.

Rule III.

Re-examinations shall be made: 1st, after any disease of the eyes; 2d, after injuries affecting the head or eyes; 3d, after any disease or trouble of the brain, and after long-continued illness, as typhoid fever; 4th, after mistakes or acts which call in question the visual powers; also, whenever directed by the board of health.

Rule IV.

The examiners shall report regularly to the State board of health, and their work shall at any time be open to the inspection of any member or members of said board.

Rule V.

The regulations for conducting the examinations and the standards for each class shall be determined by the board of health, and not by the examiners. New rules and regulations shall be adopted from time to time as required, and alterations and amendments made.

RULES FOR CONDUCTING EXAMINATIONS.

Rule I.

For the *qualitative* estimation of color-blindness, the following tests are to be employed: Holmgren's Worsteds, the Tables of Stilling, Donder's Color Test Patterns, Plüger's LETTERS WITH TISSUE PAPERS. Dïae tests and Woinow's Revolving Cards may also be used.

For the *quantitative* test for color-blindness: Donder's Reflected Spots, Donder's Method with Transmitted Light, Holmgren's Shadow Tests shall be employed.

Rule II.

The following are the requirements for a certificate in the first class:

1. Healthy eyes and eyelids, without habitual congestion or inflammation.
2. Unobstructed visual field.
3. Normal visual acuteness.
4. Freedom from color-blindness.
5. Entire absence of cataract or other progressive disease of the eyes.

The second class shall have:

1. Healthy eyes and eyelids without habitual congestion or inflammation.
2. Unobstructed visual field.
3. Visual acuteness at least equal to $\frac{6}{9}$ without glasses and normal with glasses in one eye, and at least $\frac{1}{2}$ in the other eye with glasses.
4. Freedom from color-blindness in one eye, color-perception at least equal to $\frac{3}{4}$ in the other eye.

Rule III.

In the case of employés who have held their positions five years or

more, the standards required in each class shall be determined under special instructions from the board of health.

By order State board of health.

C. W. CHAMBERLAIN, M. D., *Secretary.*

Connecticut is a pioneer in this work in this country, being the first State to pass a law requiring examination of all railroad employés engaged in moving trains. The standards adopted are for the most part those agreed upon at the International Medical Congress at Amsterdam, September, 1879.

The forms of certificate are bound in books, the stubs retained for reference and tabulations.

ABSTRACTS FROM CONSULAR REPORTS.

ANTWERP, BELGIUM.—During the week ending July 17, there were 25 deaths from small-pox, out of a total of 110 from all causes. The authorities have declared small-pox as no longer epidemic.

BARBADOES, WEST INDIES.—The report of United States Consul W. H. Polleys for the month of June shows a total of 61 deaths in a population of 20,000; annual rate 36.6 per 1,000; mean temperature 83. 5; no epidemic diseases, and sanitary condition good.

BRADFORD, ENGLAND.—United States Consul C. O. Shepard sends a report for the week ending July 17, showing a total of 65 deaths, of which 31 were under 5 years, 18 under one year, and 11 over 60 years of age. Among the causes of death were: scarlet fever 8, whooping-cough 1, and 2 from violence.

BUDA-PESTH, HUNGARY.—United States Consul Henry Sterne, under date of June 20, calls attention to the fact that small-pox is epidemic in Zemplin and other parts of Hungary, from which many emigrants go to the United States.

GUAYMAS, MEXICO.—The report for the month of June gives only 10 deaths in a population of 5,500, being at the annual rate of 21.8 per 1,000. Of the 10 deaths, 3 were due to accidents and injuries, leaving a proper death rate from disease of less than 15 per 1,000.

PARA, BRAZIL.—United States Consul A. C. Prindle reports for the month of June 161 deaths in a population of 40,000, giving an annual death rate of 48.3 per 1,000.

SINGAPORE.—United States Consul A. G. Studer, under date of June 28, reports this city and the adjacent country free from infections or contagious diseases in epidemic form.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

CAMDEN, N. J.—Dr. J. H. Wroth, physician in charge of the city dispensary, sends a report of small-pox, under date of August 4. Up to July 31 the city physicians had reported 48 cases of small-pox and 6 of varioloid. Of these cases 14 were fatal, and 28 remained under treatment. The report does not include any other cases than those occurring among the poor, and attended by the city physicians.

CARTHAGE, MISS.—Dr. W. R. Blalock, under date of August 5, describes this town as situated in Leake County, about 14 miles north of the present head of navigation of Pearl River, and having about 300 inhabitants. The remaining part of that division of Leake County known as "Beat No. 2" has a population of 3,546. During the year ending May 31, 1880, there were 32 deaths in the total population of 3,846, being at the rate of 8.3 per 1,000. The white population being 2,114 and the deaths 20, the rate was 9.4; colored population 1,552, deaths 11, rate 7.1; there are about 180 Indians, among whom one death is noted, cause unknown. The causes of death among the whites were: dysentery 3, other diseases of the bowels 2, pneumonia 1, consumption 1, bronchitis 2, gastritis 1, congestion of lungs 1, typhoid fever 1, disease of brain 1, disease of heart 1, malarial fevers 2, convulsions 2, unkown 1, old age 1. The fatal cases among the colored people were: consumption 1, bronchitis 1, disease of brain 1, diseases of heart 2, malarial fevers 2, cancer 1, unknown 2, old age 1. The deaths under 5 years were, 7 white, or 35 per cent., and 3 colored, or 27 per cent. of the whole mortality, for each race.

HAVANA, CUBA.—During the week ending July 30 there were 51 deaths from yellow fever, most of which were among the citizens. At the above date it is estimated that there were 200 cases of the fever in the city. The list of vessels supposed to be infected was published in the BULLETIN No. 6, page 481.

LANSING, MICH.—Dr. H. B. Baker has collected reports for the week ending July 17, from 65 physicians in different parts of the State. The reports show that malarial fevers were most widely distributed in the State at that time, and diarrhœal diseases were next in frequency.

MINSTER, OHIO.—Under date of July 6, Dr. E. T. Wells gives a report of mortality for the year ending June 1, 1880. The population by the recent census is 1,132. The deaths for the year were 22, being at the rate of 19 per 1,000. The causes of death were: diptheria 9, summer diarrhœa 3, puerperal fever 2, Bright's disease 1, diseases of the brain 2, pneumonia 1, cholera morbus 1, convulsions 1, general debility 1, and old age 1. Diphtheria, which has been very fatal in that region for three years past, has now nearly disappeared. During May and June the usual summer diarrhœal diseases, and especially cholera morbus, have been very prevalent.

MOBILE, ALA.—Dr. T. S. Scales, health officer, forwards the following history of yellow fever on board the bark *R. W. Wood*, as given by the captain to Dr. George H. Fowler, quarantine physician, August 2, 1880:

The bark *R. W. Wood* was built in Elsfleth, Germany, in March, 1860, and her regular trade has been from Boston, Mass., to the Cape of Good Hope.

Capt. E. L. Willar's first voyage in this vessel was from Philadelphia, loaded with lumber and corn, to Trinidad Isle, and from Trinidad to Washington City, D. C., with a cargo of crude asphalt, and from Washington, loaded with coal, to Havana.

The bark left Washington June 7, 1880, and arrived in Havana on June 27. While in Havana she lay near the Matanzas Railroad wharf for 15 days, discharging cargo and taking on ballast. The locality of the railroad wharf was considered healthy, and she did not lie at any time on the Havana side of the harbor. The entire crew were shipped in Washington. The captain and all the crew were on shore while in Havana except the steward, Hafficke, Seaman Jonas Berg, and Seaman E. Thurins. The bark left Havana July 12, and the captain was the first man taken sick, July 18. Charles Norris, seaman, was next taken, July 19. Halvar Matson, seaman, was next taken, July 20. E. Thurins and William Harris, seamen, were next taken, July 21, and the second mate, William W. Patterson, was the last man taken sick, July 22. Charles Norris, seaman, was the first to die on board the vessel, July 21. William Harris, seaman, was the second who died on board, July 24, and Second Mate William W. Patterson died in hospital at this station July 29. The bark *R. W. Wood* arrived here July 25, about 11 a. m. Capt. E. L. Willar and the two sailors are convalescing on board. The first mate, Sheehan, and the steward, Hafficke, have had yellow fever, but not on this voyage, and Jonas Berg, seaman, has never had the fever.

The captain reports that the weather was warmer in Washington and in Trinidad than in Havana, the thermometer showing a mean of 82 in Havana, while in Washington it was over 90°.

The bark is quarantined fully a mile from any other vessel, and no person is allowed any communication whatever with her except myself. Every precaution possible has been taken to prevent the spread of the disease.

MUSCATINE, IOWA.—Under date of August 7, Dr. F. H. Little reports that a slight epidemic of scarlet fever, which had occurred in May, has again appeared, but only one death is reported. The usual summer diarrhœa prevails among children, but the mortality is small. Malarial fevers are not more common than usual, and the sanitary condition of the city is better than it has been for several years past.

NASHVILLE, TENN.—Dr. W. M. Clark, secretary of the State board of health, writes that scarlet fever is not epidemic in Nashville, though it has prevailed to some extent. With regard to coffee imported on the infected ship *Excelsior* to New Orleans, it is stated, on the authority of the general agent of the Louisville and Nashville, and South and North Railroad, that the whole or a portion of the coffee passed through Nashville, consigned to Chicago, and that this transportation occurred the day before the order of quarantine was issued by the State board.

TUXPAN, MEXICO.—Dr. A. M. Boyd reports 26 deaths for the month of May, of which 3 were from small-pox, 13 from malarial fevers, 2 from measles, and 8 from accidents and injuries. At the date of report, June 12, there was no yellow fever, and the general health of the place was better than usual for the season.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JULY 31, 1880.

Total population, 458,401; deaths under 5 years, 76; total deaths, 147; annual rate per 1,000, 18.7.

INSPECTION OF VESSELS AND TRAINS AT PENSACOLA.

Extract from the proceedings of the board of health of the city of Pensacola at a meeting July 27, 1880. Mayor O'Neal offered the following resolution, which was unanimously adopted:

Whereas this board of health is charged with the duty of protecting the public health of this community against the introduction of contagious or infectious diseases: Be it, therefore,

Resolved, That on and after the publication of the mayor's proclamation, no vessels or freighted cars coming from an infected city or place will be allowed to land at the wharves or enter the city without a certificate from an officer of the board of health certifying that he has personally examined the freight of such vessel or car, the officers, passengers, and crew thereof, and has satisfied himself of the freedom from infection of said vessel or car, officers, and passengers thereof, and that the freight or cargo comprises none of the following articles, which are excluded from entrance into this city or port, namely: Woolen textile fabrics, cotton, hemp, coffee, second-hand clothing, upholstered furniture, tropical fruits and productions; and, for the purpose of carrying this order into effect, an officer or officers shall be appointed and stationed at Pensacola Junction or on the trains for examination of such certificates or passes.

Attest:

S. T. PONS, *Clerk.*

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, AUGUST 21, 1880. [No. 8.

THE DEATH-RATE OF SING SING, N. Y.

The mortality of this village of 7,500 inhabitants, as reported by Mr. George Lockwood, clerk of the corporation, and published in the BULLETIN of the National Board of Health, has attracted the attention of New York life-insurance companies. The death-rate from May 8 to July 3 ranging from 41 to 48 per 1,000 per annum, while that of New York City was only from 26 to 33 for the same period, a letter of inquiry was addressed by the secretary of the Manhattan Life Insurance Company to Dr. G. J. Fisher, of Sing Sing. He replied that the figures given in the BULLETIN were "shamefully erroneous." Mr. Lockwood very candidly admits that his reports, obtained from the undertakers, have included burials of persons dying in New York City, some from adjoining towns, many from places without the corporation limits, and also the deaths in the State prison. The latter place includes some 1,700 convicts, and the deaths probably amount to one-third of the total number reported. This statement of course removes the charge of inaccuracy on the part of the National Board of Health, and Dr. Fisher, in acknowledging this, forwards the following as the correct report of deaths and rate of mortality for the dates given: Week ending June 5, 2 deaths; rate 13.9. June 12, no deaths; June 26, July 3, 10, and 24, three deaths in each week; rate 20.8 per 1,000 per annum.

CATTLE PLAGUE IN ERIE, PA.

The papers of August 11 and 12 note the occurrence of a disease which has caused the death of nine cows in the eastern part of the city, and many more are sick. The nature of the disease is not specified, but the health officer, Dr. Germer, ascribes it to improper food and impure water used by the animals in that locality. The term "cattle plague" is used in the papers, but the brief statement given indicates a non-contagious disease of local origin and removable cause.

ABSTRACTS FROM CONSULAR REPORTS.

BRADFORD, ENGLAND.—United States Consul C. O. Shepard reports for the week ending July 28 a death-rate of 17.5 per 1,000 per annum, and a birth-rate of 35; the deaths being 66 and the births 132 for the week. Among the causes of death were: scarlet fever 4, whooping-cough 3, typhoid fever 1, and diarrhœa 9; under 5 years of age 34, and 20 under 1 year; five deaths were at 60 years and over.

CONSTANTINOPLE.—Under date of July 29, United States Consul G. H. Heap reports great improvement in the famine-stricken villages, and no contagious diseases prevailing in his consular district. In some places an epizoötic disease is still causing a number of deaths among horses.

HONOLULU, SANDWICH ISLANDS.—United States Consul F. P. Hastings sends reports of mortality for the months of May and June. In May there were 46 deaths, of which 9 were under 1 year, 2 from 1 to 5, 7 from 5 to 20, 5 from 20 to 30, 6 from 30 to 40, 8 from 40 to 50, 5 from 50 to 60, and 4 over 70 years of age. Of those who died, 39 were natives, 5 Chinese, 1 English, and 1 German. Among the causes of death were: accidents 2, consumption 7, convulsions 2, debility 1, dysentery 3, dropsy 10, typhoid fever 3, old age 4, unknown 7.

In July there were 41 deaths, of which dysentery caused 2, paralysis 2, consumption 7, heart-disease 4, debility 2, typhoid fever, 1, old age 1, and unknown 13. Of the 41 decedents 5 were under 1 year, 2 from 5 to 10, 2 from 10 to 20, 4 from 30 to 40, 6 from 40 to 50, 6 from 50 to 60, 4 from 60 to 70, and 3 over 70 years of age.

LEEDS, ENGLAND.—For the week ending July 24 there were 213 births and 126 deaths in the borough of Leeds. The death-rate was 20.6 and the birth-rate 34.8 per 1,000 per annum. Of the decedents 38 were under one year, and 20 over 60 years of age. Mean temperature, 58°.6. Among the causes of death were: diarrhœa 17, scarlet fever 5, typhoid fever 2, whooping-cough 1.

MOSCOW, RUSSIA.—United States Consul August Weber, under date of July 26, sends a correction of the deaths reported for February and March. The medical inspector of the city omitted to include deaths from certain non-contagious diseases in his report to the consuls, and the numbers should have been 2,107 for February and 2,552 for March. The published mortality for April was 2,607, of which 1,203 were under 5 years of age. Among the causes of deaths were: Typhus fever 99, malarial fevers 98, small-pox 9, scarlet fever 21, measles 40, dysentery 7, diphtheria 21, whooping-cough 31, puerperal fever 15, syphilis 51, consumption 370, gastro-intestinal diseases 345, diseases of respiratory system 116, accidents 16, violent deaths 3, suicides 10, still-births 87.

PORT AU PRINCE, HAYTI.—United States Consul J. M. Langston, under date of July 27, states that although this is the usual rainy season in Hayti, and rain has fallen on most parts of the island, a remarkable drought has prevailed for some time about Port au Prince. The water supply of the town for domestic purposes is derived from seven springs, mostly high up on the mountains. Of these two are now dry, and the rest give such a reduced supply that serious inconvenience is anticipated unless rain falls soon. But while the heat and the clouds of dust are very oppressive and cause much discomfort, the health of the town is better than usual, and no sickness prevails among the shipping. During the summer there has been as yet no case of yellow fever, and but one of typhoid fever, which proved fatal July 20. The leading physician of the place states that this is the third case he has known to appear here in five years. The season for yellow fever is now past, and there are no apprehensions of its occurrence here this year.

VIENNA, AUSTRIA.—For the year 1879, a total of 20,778 death is reported, giving an annual rate of 28.8 per 1,000. The report states that for the same year the death-rate was 35.1 for Trieste, 31.6 for Buda Pesth, 27.7 for Berlin, 26.9 for Paris, and 21.4 for Frankfort, which was the lowest of European cities. Of violent deaths there were 396, and the suicides are stated at 2.8 per 1,000 of the population. The lowest number of deaths monthly was 1,400, in September; the highest, 2,116, in March.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BAY CITY, MICH.—Thomas Carney, health officer, writes under date of August 10, stating that the county clerk's report for the year 1879 gives 184 deaths from all causes. The population being estimated at 20,638, the death-rate for 1879 was only 8.9. Of the 184 deaths, 70 were under 9 years of age.

BURLINGTON, VT.—Dr. George M. Ockford writes under date of August 10 that during the month of July cholera morbus, cholera infantum, gastro-enteritis, &c., prevailed, and some cases of whooping-cough were observed. Continued fevers have been common in some parts of the country during the summer, but the city of Burlington shows a good condition of health at the date of writing.

HAVANA, CUBA.—For the week ending August 6 there were 43 deaths from yellow fever; during the month of July, 1,017 deaths were reported from all causes, of which 282, or 27.7 per cent., were from yellow fever. The Spanish brigs *Chanito*, for Baltimore, August 2, and *Nicolas*, for New York, August 8, are believed to have had cases of yellow fever on board while at Havana. The bark *R. W. Wood*, on board of which yellow fever appeared on her voyage to Mobile, lay at a healthy wharf, but as the crew were allowed to have free communication with the city, it is probable that they contracted the disease on shore.

NASHVILLE, TENN.—Dr. W. M. Clark, secretary of the State board of health, writes under date of July 29 that a mild form of scarlet fever is epidemic in Nashville. In the eastern part of the State dysentery is prevalent, and typhoid fever is common in the hilly portion of the country. The western portion of the State enjoys a remarkable exemption from disease for the season of the year.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING AUGUST 7, 1880.

La Salle, Ill., 10,000; deaths 4; under 5 years, 3; diarrhœa 3. Lebanon, Pa., 9,000; no deaths. Louisiana, Mo., 5,200; deaths, 2; consumption 1, diarrhœa 1. Madison, Ind., 9,009; deaths, 4; under 5 years, 1; scarlet fever 1. Mansfield, Ohio, 10,000; deaths, 2; under 5 years, 2; diarrhœa 2. Martinsburg, W. Va., 6,300; deaths, 3; under 5 years, 2; consumption 1, diarrhœa 1. Meridian, Miss., 4,013; deaths, 2: consumption 1. Milledgeville, Ga., 3,000; deaths, 1; puerperal 1. Muscatine, Iowa, 8,412; deaths, 4; under 5 years, 3; diarrhœa 3. Muskegon, Mich., 11,300; deaths, 8; under 5 years, 2; diarrhœa 6, measles 1, whooping-cough 1. Niles, Mich., 4,200; deaths, 1. Ocala, Fla., 1,000; deaths, none. Okolona, Miss., 2,000; deaths, none. Oshkosh, Wis., 17,030; deaths, 7; under 5 years, 5; diarrhœa 5, lung disease 1, accident 1. Painesville, Ohio, 5,000; deaths, 2; under 5 years, 1; consumption 1. Pass Christian, Miss., 4,000: no deaths. Pearlington, Miss., 1,200; deaths, 1; under 5 years, 1. Phœnixville, Pa., 6,692; deaths, 3; consumption 1, diarrhœa 2. Pleasant Hill, Miss., 253; no deaths. Port Royal, S. C., 750; no deaths. Portsmouth, Ohio, 2,320; deaths, 4; consumption 1. Raymond, Miss., 600; no deaths. Rock Island, Ill., 12,000; deaths, 6; under 5 years, 5; diarrhœa 2. Springfield, Ohio, 21,000; deaths, 5; under 5 years, 2; consumption 2, diarrhœa 1, malarial fever 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 1. Summit, Miss., 1,800; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; no deaths. Tuskaloosa, Ala., 2,000; deaths, 1; under 5 years, 1; malarial fever 1. Winona, Minn., 10,000; deaths, 3; under 5 years, 2; diarrhœa 2. Youngstown, Ohio, 15,089; deaths, 7; under 5 years, 5; consumption 1, diarrhœa 3. Total population, 421,209; deaths under 5 years, 65; total number of deaths, 140; annual death rate, 17.3 per 1,000.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, AUGUST 28, 1880. [No. 9.

MONTHLY REVIEW OF MORTALITY, FOR JULY, 1880.

The review for June showed a loss of over 96,000 in the mean population, as compared with April; this month there is a further reduction of 68,720, leaving 8,061,454 as the mean for July. It has been noted that the falling off in the population represented in the tables is chiefly due to irregularity in the reports of some of the larger cities. It is also to be observed that the results of the tenth census, taken in June, while showing a considerable increase in the total population of the country, also prove that many cities have greatly over-estimated their rate of increase, and given rise to corresponding errors in their computed death-rates. No official reports having yet been made by the Census Bureau, the populations of cities in the table have been changed only when corrected on the reports of mortality, or by notice from the municipal authorities. A comparison of the total population of 34 cities, before and after such corrections, indicates that while certain places were estimated much too high or too low, the total of the reports will not be changed sufficiently to have much effect on the general death-rate of the country. This death-rate for the 5 weeks ending July 31 was 26.66, against 22.05 for June; the two months show a great variation from one week to another, the rate rising from 19.46 June 5 to a maximum of 31.44 July 3, and then falling, with some oscillations, to 23.44 at the end of the month. These changes have been controlled by the movement of heat diseases, as will be shown. The deaths under 5 years contribute most to the increased mortality, the rate having risen from 8.04 June 5 to 18.44 July 3, or 129 per cent., while the general death-rate increased less than 62 per cent. in the same time. The highest mortality under 5 years reached 58.5 per cent. of all deaths.

The increase of mortality due to the prevalence of heat diseases was not considered with reference to races last month, as the effects of temperature had not then been fully developed in all parts of the country. It will be seen below that the maximum rate for the whole country was attained July 3, and that for the Southeast division in the latter part of June. It is observed that the death-rate in those cities which separate the two races in their reports reached a maximum of 24.2 for the white population July 3, beginning at 20.5 June 5, and falling to 21.0 at the end of July. The difference between the extreme rates in the two months was only 4.9, the least being 19.3 July 24. The rate for the colored population reached its maximum of 48.1 June 19, and this high rate evidently determined the period of highest general death-rate for the Southeast section, which contains nearly the whole colored population. The lowest rate for the colored people in the two months was 33.9, July 31, the difference between the extremes being 14.2. This would indicate that the colored race was much more affected by heat diseases than the white, and such was probably the case, owing to the defective hygienic conditions so prevalent among the colored population in all cities, and especially to the want of care in the selection and use of food. The absence of proper care for children both in health and sickness also contributed to raise the rate of infant mortality, and the correspondence of the Bulletin shows that for various reasons medical attendance is often wanting in sickness among the colored people.

It is held by many observers that the conditions here mentioned, with other circumstances, sufficiently account for the difference in mortality without reference to difference of race. A careful investigation of the diseases and death-rate of white populations living under conditions more or less similar to those of the colored people in our cities might assist in estimating the true weight of the difference of race in relation to disease and mortality.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Causes of death.—Consumption and acute lung diseases combined still occupy the second place in order of fatality, and their rate shows a further decline of 9 per cent. since June, having fallen from 4.16 to 3.79 per 1,000. In this reduction consumption has no part, having increased from 2.59 to 2.70, while lung diseases have fallen from 1.58 to 1.09, or 31 per cent. The following changes are noted in the six principal zymotic diseases: *Increased*, diphtheria, from 0.56 to 0.58, or 3.6 per cent.; enteric fever, from 0.27 to 0.37, or 37 per cent.; whooping-cough, from 0.24 to 0.27, or 12.5 per cent., and malarial fevers, from 0.29 to 0.35, or 20.7 per cent. The increase of the last named diseases is proper to the season, but it is not easy to explain the marked advance of enteric fever, which usually prevails most as an autumnal disease. The rise in the death-rate for the other two will be explained below. *Decreased*, scarlet fever, from 0.43 to 0.33, or 23.3 per cent., and measles, from 0.29 to 0.20, or 31 per cent. The result is an increase of only 2 per 1,000 in the total mortality of the six diseases since June, and the rapid decline of measles and scarlet fever, with the upward movement of enteric and malarial fevers, are

the most important changes in this class. Diarrhœal diseases have taken the first place among the causes of death since the latter part of June, when their rate was equal to that of consumption and acute lung diseases combined. By the 26th of June, the rate had reached 7.92 per 1,000, which was 0.92 above the highest point attained last year, and July 3 showed the enormous rate of 12.60 per 1,000 for this one class of heat diseases. This climax was followed by a less rapid decline, and the rate was 5.55 at the end of the month; at its height, the rate was over 40 per cent. of deaths from all causes, the pulmonary diseases showing only 13.5 per cent. at the same time. In 1879, the maximum rate of diarrhœal diseases was on July 17, and was only 7 per 1,000. Small-pox is still occasionally reported from Chicago, Philadelphia, and New York, but does not seem to be epidemic at any place in the United States. During the month of July infected vessels arrived at several ports of this country from South America and the West Indies, and deaths from yellow fever have been reported at the Mobile and New York quarantine stations. At New Orleans the *Excelsior* was only discovered to be infected after discharging her cargo, and one of her crew died of yellow fever in the city; but neither there nor elsewhere has the disease spread beyond those originally infected from the vessels.

Distribution of diseases.—The mortality from consumption and lung diseases has been for some time comparatively high in the Southeast section, and there the greatest reduction is observed this month, the rate having fallen 14.4 per cent. to 10.3 per cent. in the Northeast, and only 1 per cent. in the Northwest. As usual, the greatest change has been in lung diseases. Since June the rates have fallen as follows, taking the sections in the order of the table: 33.9, 40.7, and 16.2 per cent. Consumption has lost but 2.5 per cent. in the Southeast, while the rate has risen 4.5 in the Northeast and 9.6 per cent. in the Northwest sections. The increase noted above in diphtheria has been confined to the Northwest, where the rate has risen from 0.53 to 0.69, or 30 per cent.; in the Northeast it remains stationary at 0.64, but in the Southeast there is a decline from 0.34 to 0.31, or 9 per cent. Whooping-cough, having reached the high rate of 0.59 in the Southeast, has fallen to 0.50, or 15 per cent., in that section, while the rates having gone down to 0.15 in the Northeast and 0.20 in the Northwest, have now risen to 0.21 and 0.27, or 40 and 35 per cent., respectively, in those sections. The movements of these diseases are to be explained chiefly by the presence or absence of available material in different localities. The notable exemption of the Southeast from certain zymotics for many months has naturally been followed by an invasion of those diseases among the unprotected, while the decline of the epidemics in other sections was due to the death or recovery and consequent protection of the subjects there. This ebb and flow of mortality must mark the course of such diseases as are likely to occur but once in the same person, and against whose contagion or infection no certain prophylactic has been discovered. The marked decline in the rate for measles, of 35, 36, and 33 per cent. in the order of the sections seems to argue a general approach to exhaustion of available material for that disease. Diarrhœal diseases have followed the movement of the heat-wave; its first impact being upon the Southeast section, the death-rate from diarrhœal diseases reached a maximum of 7.23 per 1,000 in that section in June. Crossing the Gulf States from west to east, the isothermal lines sweep around the southern end of the Appalachian range, and, as shown on one of the maps of the Signal Service for July, carry a mean temperature of 80° up to the capes of the Chesapeake. Baltimore reached a maximum death-rate of 16 per 1,000 by June 12; New York of 29.3 per 1,000 July 3, and Boston 15.7 per 1,000 July 31. The highest rate in New Orleans was on June 12, being then 7 per 1,000 per annum. The cities of the Northwest show great irregularities in the times and degrees of greatest mortality, owing to their various elevations and other local conditions. The wide differences of maximum mortality from diarrhœal diseases in the four cities above named may be referred to the following conditions, upon which the morbific effects of heat chiefly depend: 1. A sudden elevation of temperature is more potent in causing disease than a gradual rise to a much higher point; 2. The amount of difference between the maximum temperature of any place and its annual mean, which, in the United States, is generally reached about April 21, is an important factor; the summer mortality is usually in proportion to this difference; 3. The proportion of children in any given population will materially affect the death-rate; 4. The general condition of the people, as to aggregation, hygienic conditions, occupations, habits of food and drink, and previous state of health, must influence their resistance to the effects of heat. Taking the mean mortality for the month from diarrhœal diseases, the highest rates were 7.23 in the Southeast, 6.58 in the Northwest, and 10.12 in the Northeast.

A BILL TO RECHARTER THE SOUTH CAROLINA MEDICAL ASSOCIATION AND ESTABLISH A STATE BOARD OF HEALTH, AND TO DEFINE ITS DUTIES.

Be it enacted by the senate and house of representatives, now met and sitting in general assembly, and by the authority of the same:

SECTION 1. That the charter of incorporation of the South Carolina Medical Association granted by the act of the general assembly of the State of South Carolina, entitled "An act to incorporate certain societies of South Carolina, and to renew certain charters heretofore granted," passed on the nineteenth day of December, one thousand eight hundred and forty-eight, with the rights and privileges therein contained, be revived and made of force and continued for the term of fourteen years.

SEC. 2. That S. S. Marshall, M. D., president; F. L. Parker, M. D., first vice-president; J. B. Du Bose, M. D., second vice-president; J. J. Horton, M. D., third vice-president; H. D. Fraser, M. D., corresponding secretary; A. S. Hydrick, M. D., recording secretary; T. Grange Simons, M. D., treasurer, and their associates, members of the South Carolina Medical Association, and their successors, in their corporate capacity, together with the attorney and comptroller generals of the State, and their successors in office, be, and the same are hereby, created a board of health for the State of South Carolina, to be known as the State board of health.

SEC. 3. That the said South Carolina Medical Association, with the State officers above named, are hereby invested with all the rights, and charged with all the duties pertaining to organizations of like character, and said board of health, so constituted and established, shall be the sole adviser of the State on all questions involving the protection of the public health within its limits, and it shall be the duty of the said board to make an annual report to the legislature on all matters relating to its action.

SEC. 4. That the said association, at its first meeting succeeding the passage of this act, and every seven years thereafter, shall select seven (7) members, to be recommended to the governor, who shall appoint them to co-operate with the State officers above named, to constitute an executive committee, having power to act in the intervals of the meetings of the State board of health. This committee shall make, annually, a detailed report to the State board of health. Members of this committee shall be removable at the pleasure of the

governor, by him at the request of the State board of health, or for neglect of duty, or other causes set forth by the majority of the members of the executive committee. Vacancies shall be filled by appointment by the governor, on recommendation of the State board of health, or of the executive committee, when such vacancies occur in the intervals of the meetings of the association.

SEC. 5. That this executive committee shall, immediately after their appointment, proceed to organize by electing a chairman and secretary, the latter to be *ex-officio* registrar-general of the State. That they be authorized and empowered to divide the State into health districts, and in those districts in which no local boards of health exist they be required to appoint sub-boards of health, which shall consist of two (2) practicing physicians and one (1) layman. In all cases where local boards of health have already been established, these shall be subject to the supervisory and advisory control of the State board of health, through its executive committee. They shall pass no ordinances, nor consider any such of force, as are repugnant to the rules and regulations of the State board of health.

SEC. 6. That it shall be the duty of the State board of health, through its representatives, to investigate the causes, character, and means of preventing such epidemic and endemic diseases as the State is liable to suffer from; the influence of climate, localities, occupations, habits, drainage, scavengering, water supply, heating, and ventilation; and shall make inspections annually, or oftener if necessary, of the sanitary condition of all institutions provided as State charities or supported at the public expense.

SEC. 7. That the sub-boards, constituted as provided in section 5, and local boards of health already organized, are charged with the duty of investigating, within their districts, all matters of sanitary interest, or scientific importance, bearing in any wise upon the protection of the public health; and shall report to the executive committee at such times and in such manner and form as the executive committee may prescribe.

SEC. 8. The State board of health shall supervise and control the quarantine system of the State, and shall annually, or oftener if necessary, require reports from the health officer, on such forms as may be prescribed, in all matters pertaining to quarantine. They shall also be authorized to establish quarantine both by land and sea. This quarantine shall not be established except by the advice and consent of the governor.

SEC. 9. That it shall be the duty of the executive committee of the State board of health to recommend such provisions of law as shall be deemed necessary for the thorough organization of a system of registration of vital statistics throughout the State, and shall prepare the necessary methods and forms for obtaining and preserving such statistics.

SEC. 10. For the purpose of carrying out the provisions of this act the sum of two thousand dollars be, and the same is hereby, appropriated, to be paid by the treasurer on the order of the chairman of the executive committee, countersigned by the comptroller-general.

SEC. 11. This act shall take effect from the date of its passage; and all acts and parts of acts inconsistent herewith be, and the same are hereby, repealed.

ABSTRACTS FROM CONSULAR REPORTS.

FLUSHING, NETHERLANDS.—The report for the last two weeks of July notes only 4 deaths, all under 15 years of age. One was from typhoid and one from typhus fever; population not given; general sanitary condition good.

GHENT, BELGIUM.—United States Consul S. Spackman reports for the month of June 305 deaths in a population of 130,670, being at the rate of 28 per 1,000 per annum. Cholera caused 2 deaths, small-pox 6, typhoid fever 6, and other contagious diseases 3. There were 35 deaths from consumption, 21 from other lung diseases, and 93 from diarrhœal diseases, chiefly among very young children.

HAVANA, CUBA.—For the week ending August 13 there were 42 deaths from yellow fever in the city, but the mortality is small compared with the number of cases, the disease being of a mild form. It is estimated that there were about 150 cases in the city at the above date.

LAMBAYEQUE, PERU.—The report of United States Consul S. C. Moutjoy for this department, dated June 30, states that statistics of diseases and deaths cannot be obtained. The population is estimated at 100,000; the sanitary condition is usually considered good, but at present croup, diphtheria, and small-pox prevail and are very fatal. Typhoid and scarlet fevers are also common, but of milder type.

MALTA AND GOZO—United States Consul C. B. Eynaud reports 160 deaths for the two weeks ending July 15; population 153,500; annual death-rate 27.1 per 1,000; mean temperature 79°.5. Two deaths are noted from small-pox, 4 from typhoid, and 1 from typhus fever. Among other causes of death were: diarrhœal diseases 47, consumption 3, other lung diseases 6, heart diseases 4, old age 8, accident 1; 9 still-births not included in the deaths.

MAZATLAN, MEXICO.—United States Consul E. G. Kelton reports the town in fair sanitary condition, and no epidemic or contagious diseases prevailing. There were 52 deaths from all causes during the month of June, in a population of 14,000, being at the annual rate of 44.5 per 1,000. Among the causes of death were: dysentery and diarrhœa, 7; "fever," 10; consumption, 2; and *tetanus*, 9. This latter disease is often noted in the reports as "tetanus of children," and, no doubt, means "convulsions."

MOSCOW, RUSSIA.—The report for the month of April shows 2,607 deaths; the population being 601,970; the annual death-rate was nearly 52 per 1,000. There were 1,203 deaths under 5 years of age, being 46 per cent. of all deaths. Among the causes noted were: small-pox 9 deaths, typhoid fever 197, other contagious diseases 193, diarrhœal diseases 345, diseases of the respiratory organs, including consumption, 786. The almost total absence of drainage, with the bad condition of paving, &c., chiefly accounts for the high death-rate; improvements in this direction are making, but very slowly. The climate is usually very favorable to health.

NASSAU, BAHAMAS.—United States Vice-Consul S. P. Saunders, under date of August 11, refers to his report of yellow fever on the island of New Providence. He reports further, that during the week ending July 17 there were 15 cases and 6 deaths; July 24, 20 cases and 2 deaths; July 31, 11 cases and 4 deaths; August 7, 5 cases and 1 death—total, 51 cases and 13 deaths. The disease reached its climax about the middle of July, when the weather was very hot and dry; with August came cooler weather, and the disease abated. The fever has been chiefly confined to children under 15 years, and the few unacclimated adults who were attacked all died. One of these had been a resident of the island for seven consecutive years. It is remarkable that no adult native of the island was attacked, yet the natives of other and neighboring islands coming here were very liable to contract the disease, and seldom recovered from it. These persons were supposed to be acclimated and safe from yellow fever. The meteorological department of the city reports that the test-papers showed no ozone in the atmosphere during the hot weather when the fever prevailed, but became highly discolored on the change of weather which marked the abatement of the disease. The authorities have been active in enforcing all sanitary measures, and the town is now very clean.

The last visitation of yellow fever was in 1869, when the disease was introduced by a British ship-of-war. Since then the island has been very healthy at all seasons until the present epidemic.

ROUEN, FRANCE, August 7.—United States Consul A. Rhodes reports that although small-pox prevails, the masters of vessels seldom take bills of health from his consulate, saying that "the health officers of New York and most other ports of the United States do not ask for them."

SABANILLA, UNITED STATES OF COLOMBIA.—United States Consul E. P. Pellet, under date of July 31, reports the death of a sister of charity from yellow fever in the hospital at Baranquilla; the sister had recently arrived, and no other case had yet occurred. While awaiting the possible spread of the disease, the issue of clean bills of health has been suspended.

SANTA CRUZ, TENERIFFE, CANARIES.—United States Consul W. H. Dabney reports for the month of June 36 deaths and 38 births. The death-rate was 26.1 and the birth-rate 27.5 per 1,000. Of the decedents 9 were under 1 year, 16 under 5 years, and 4 over 75 years of age.

SHEFFIELD, ENGLAND.—The following report of births and deaths in the borough of Sheffield is for the four weeks ending June 5: Births, 891, of which 464 were males; annual rate per 1,000, 38.1. Deaths 478; annual rate per 1,000, 20.5. Only one case of small-pox is noted, being the first since May, 1878; the disease occurred in a child who died of bronchitis after recovery from the small-pox. Scarlet fever caused 23 deaths, whooping-cough 16; there were 222 deaths under 5 years and 9 over 80 years of age; 19 deaths were from unknown causes. The highest temperature noted was 70°, lowest 32°, mean 51°.1; mean humidity 75; rain-fall 2.29 inches.

For the quarter ending June 26, 2,853 births were registered, of which 1,131 were females; annual rate 37.6 per 1,000. Deaths, 1,613, of which 867 were males; annual rate 21.2 per 1,000. There were 15 deaths from measles, 98 from scarlet fever, 59 from "fever," 23 from diarrhœa, and 71 from causes not ascertained. The mean temperature for the quarter was 50°.3, highest 75°, lowest 31°; mean humidity 78; rain-fall 7.04 inches for the 13 weeks.

ST. JOHN, NEW BRUNSWICK.—United States Consul D. B. Warner reports a total of 78 deaths for the five weeks ending July 31, but gives neither the causes of death nor the population.

VALPARAISO, CHILI.—United States Consul L. H. Foote sends the following reports: During the month of May there were 386 deaths in a population of 101,100; death-rate 45.8. Lung diseases caused 74 deaths, fevers 97, small-pox 31, consumption 50, other diseases 134. In June, the deaths were 338, and the annual rate 40.1 per 1,000. The sanitary condition of the city is improving.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

LOS ANGELES, CAL.—Dr. Walter Lindley, under date of August 3, gives the following account of the climate and meteorology of this place:

Medical gentlemen in Brooklyn, Boston, New York, Baltimore, and other Eastern cities have been constantly sending me letters full of questions in regard to the climate of Los Angeles, and asking me what effect I thought it would have on certain patients of theirs who had pulmonary troubles. I commenced answering their communications, but the task became too great, and I now ask you, through the BULLETIN, to convey to them the following facts: The sun shines brightly in Los Angeles three hundred and forty days in the year. The following tables, prepared from the reports of the United States Signal Service in Los Angeles, by D. M. Graham, esq., and published in the Semi-Tropic California, are very valuable to those who contemplate sending patients here:

TABLE No. I.—*Rainfall.*

	1877–'78.		1878–'79.		1879–'80.		Monthly average.
	Inches.	Days.	Inches.	Days.	Inches.	Days.	
July	.0	1	.0	0	.0	0	.0
August	.0	2	.0	1	.0	0	.0

June	.07	5	.03	2	.03	2	.03
Totals	21.26	73	11.35	41	20.34	48	17.62

Annual average, 17.62 inches.

TABLE No. II.—*Temperature.*

Month.	Mean.	A. M.	P. M.	Mid-night.	Maxi-mum.	Mini-mum.	Differ-ence.
1877.							
July	71.1	63.7	80.7	88.8	93	55	38
August	70.1	61.8	79.9	68.4	87	56	31
September	69.8	61.6	79.6	67.6	93	57	41
October	63.4	56.6	71.1	62.4	70	43	37
November	62.1	53.6	73.1	59.6	86	45	41
December	55.3	49.5	63.9	54.5	81	36.5	44.5
1878.							
January	54.1	48.6	62.6	53.6	72	37	35
February	54.6	48.7	61.7	71.6	71	41	30
March	55.8	48.9	63.3	55.8	76	41	35
April	58	51.8	64.6	57.1	80	41.5	38.5
May	62	55.9	69.9	60.6	89	47	42
June	72	59.5	72.7	62.8	81	47	34
Annual mean	62.4	55.4	70.3	63.6	82	46	37

It will be observed that in the average of the year it rains about one day in the week; not all day, however. The most days in any one month was just half the days in February, 1878. That was a very wet month and touched the idea prevalent of six months of our year. But the table shows that the average for the rainy six months is forty-two days, and many of these days are only showery.

Messrs. Woodhead & Gay, fruit dealers, prepared for Mr. Graham the following table, showing the times during the year when the various fruits are ripe and in market in Los Angeles.

Oranges	Christmas to July.
Lemons	All the year.
Limes	All the year.
Apples	July to November.
Pears	July to December.
Grapes	July 15 to December.
Raisins	October 20 (new).
Peaches	June 15 to Christmas.
Apricots	June 15 to September.
Plums and prunes	June 1 to November.
Cherries	June.
Japanese persimmons	November.
Guavas	Nearly all the year.
Loquats	May 15 to June 15.
Strawberries	Nearly all the year round.
Raspberries	June 15 to September.
Blackberries	June 15 to September.
Currants	May 15 to June 15.
Gooseberries	June.
Watermelons	July to October.
Muskmelons	July to October.

Los Angeles is fourteen miles from the Pacific, and is accessible by five railroads.

INFECTED VESSELS AT NEW YORK QUARANTINE.

Dr. W. M. Smith, health officer, under date of August 13, gives the following account of infected vessels arriving at his station:

The schooner *Augustus J. Fabeus* arrived at this port from Port-de-Paix the 6th instant with a cargo of logwood.

The captain, mate, and steward were sick on arrival, and were sent to hospital on the 7th. Two seamen were sent to hospital from the same schooner, all sick with the malarial fever common to ports in Hayti. These, and indeed most other cases on the vessels laden with logwood, have assumed a typho-malarial type, those on the Austrian bark *Treci Dnbroracki* most notably. This bark took a cargo of logwood at Port-de-Paix, Hayti, leaving there June 6. One man was taken sick on the day of departure, and died June 10, at which date five others were taken sick. June 15 the captain was taken sick, and died June 23.

On arrival at this port, June 24, but one man and one boy of a crew of fifteen were able to do duty. Eleven men were removed to hospital, all of them very sick, one being in a comatose condition and another delirious; of the eleven, three died in hospital.

This vessel was in the foulest condition imaginable. The limited space on deck not occupied by logwood, as also the forecastle, was indescribably filthy.

On opening the hatches the offensive gases that issued from them were oppressive on every part of the vessel. This vessel was discharged in quarantine and thoroughly cleansed, when *pratique* was given, and she was allowed to load at the wharf.

Since my report of the cases occurring on the steamer *Colon*, two of a similar character have occurred on the steamship *Acapulco*, leaving Aspinwall June 16, arriving at this port June 24.

July 29, steamer *Niagara* arrived at this port five days from Havana. After detention a few hours at the Lower Quarantine, for fumigation, &c., the vessel was sent to Upper Quarantine to discharge. The day following I found John McBride, a fireman, sick. He had evidently been ill two or three days, and avoided observation at the visit of the deputy to the steamer on the 29th. This man died of yellow fever August 1.

August 4, steamer *Saratoga* arrived at Lower Quarantine, having sailed from Havana the 31st of July. William McCologan, fireman, was taken sick with yellow fever. This man has been very sick—hemorrhage from the nose, ears, and bowels has been a marked feature in the case; he is now convalescent. On the 5th, Axel Abrahamsen, a steerage passenger, was taken sick with yellow fever, and sent to hospital, where he died on the 11th instant.

The *Saratoga*, discharged at Quarantine, in the Upper Bay, was thoroughly cleaned and disinfected, and on the 7th instant given *pratique*.

August 11, the steamer *City of Vera Cruz* entered Lower Quarantine from Vera Cruz July 29, via Havana August 7.

Arthur Liers, a steerage passenger, having yellow fever, was sent to hospital soon after the arrival of the steamer. He was taken sick on the 9th, complaining the first day only of supra-orbital headache. The symptoms of this case have been extremely unfavorable from the day of admittance to the hospital. Early in the day of his admission a few ounces of highly albuminous urine was passed; complete suppression of urine has existed since the afternoon of that day. At this date black vomit has been frequent for the past eighteen hours.

The *Vera Cruz* will discharge at Upper Quarantine her entire Havana cargo, and, after a satisfactory cleansing and disinfection, will be allowed to proceed to her wharf to discharge the cargo taken at Vera Cruz, which, it should be remarked, is stowed in the hold, the Havana cargo being between decks.

Careful observation of the history of these cases of yellow fever leads one to the following conclusions, to wit:

The case taken from the *Niagara*, the 30th instant, and the two removed from the *Saratoga* the 4th and 5th instant, if the history was correctly given, received the infection at Havana in the open bay; both the steamships named having taken their cargo by lighters, and neither of the cases referred to left the vessel while in the harbor of Havana.

Three directions are open to suspicion, either one of which may be the source of the infection: the cargo, the atmosphere of the bay, or the vessel itself. It is not my purpose to express an opinion as to which of these gave rise to the disease. The antecedent history of the case occurring on the *Vera Cruz* renders the source of the infection much less doubtful. This man was engaged as receiving clerk in the office of a gas company, doing business a short distance out of the city of Havana. On the day he left Havana he delivered some papers at No. 76 Cuba street, in that city, and then proceeded to the "Sugar Wharf," from which he was taken to the steamship.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING AUGUST 14, 1880.

Fayette, Miss., 400; no deaths. Gun City, Mo., 125; no deaths. Helena, Mont., 3,630; whooping cough 1, under 5 years. Hernando, Miss., 1,000; no deaths. Huntingdon, Pa., 4,500; consumption 1. Huntingdon, Tenn., 1,200; one death. Inka, Miss., 816; no deaths. Jefferson, Tex., 3,251; no deaths. Kenosha, Wis., 5,000; no deaths. Key West, Fla., 1,200; deaths, 4; under 5 years 4; consumption 1, diarrhœa 2, enteric fever 1. La Salle, Ill., 10,000; one death; under 5 years. Lebanon, Pa., 9,000; deaths, 5; under 5 years, 3; diarrhœa 1, enteric fever 3. Madison, Ind., 9,009; deaths, 9; under 5 years, 8; croup 1, diphtheria 1, scarlet fever 6. Meridian, Miss., 4,013; one death; under 5 years. Milledgeville, Ga., 3,000; deaths, 2; diarrhœa 1, pneumonia 1. Monmouth, Ill., 6,000; pneumonia 1; under 5 years. Mount Pleasant, Iowa, 4,500; deaths, 2; under 5 years 1; enteric fever 1. Muscatine, Iowa, 8,112; deaths, 3; under 5 years, 1; diarrhœa 1, scarlet fever 1. Natchez, Miss., 7,000; enteric fever 1. Niles, Mich., 4,200; no deaths. Ocala, Fla., 1,000; no deaths. Okolona, Miss., 2,000; no deaths. Oshkosh, Wis., 17,030; deaths, 8; under 5 years, 2; consumption 1, diarrhœa 5. Painesville, Ohio, 5,000; no deaths. Pass Christian, Miss., 4,000; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; consumption 1. Pleasant Hill, Miss., 253; no deaths. Port Royal, S. C., 750; diphtheria 1. Rock Island, Ill., 12,000; deaths, 6; under 5 years, 4; consumption 1, diarrhœa 2, scarlet fever 1, pneumonia 1. Rockland, Me., 7,500; deaths, 4; under 5 years 1, consumption 2, measles 1, old age 1. Springfield, Ohio, 21,000; two deaths. Steubenville, Ohio, 13,500; deaths, 4; under 5 years 2. Summit, Miss., 1,804; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths 5; under 5 years, 2; consumption 1, croup 1, old age 1. Verona, Miss., 1,000; malarial fever 1. Waxahachie, Texas, 2,000; deaths, 6; diarrhœa 2, malarial fever 2, whooping-cough 2. Wesson, Miss., 2,000; diarrhœa 1, under 5 years. Winchester, Va., 5,000; consumption, 1. Winona, Minn., 10,000; deaths 4; under 5 years, 2; croup 1, diarrhœa 1. Youngstown, Ohio, 15,089; deaths, 4; under 5 years, 3; diarrhœa 2, pneumonia 1. Total population, 406,783; deaths under 5 years, 59; total number of deaths, 139; annual death rate 17.8 per 1,000.

INSPECTORS' REPORTS.

Bay St. Louis, Hancock Co., Miss.—Inspector E. Latham writes under date of August 18, that the schooner Theresa G., of Shieldsboro, arrived that morning from Havana, having left that port on the 14th. She was boarded, and no one found sick, but the vessel having entered Mississippi Sound through Cat Island Pass, to the westward of Ship Island, she was sent back to the quarantine station at Ship Island for fumigation. Two schooners, the Mary A. Rushing and the Henrietta Esch, from Tuxpan, Mexico, have passed through the sound near Bay St. Louis, for New Orleans, via the Rigolettes, within the past three weeks.

A dispatch from Havana to the National Board of Health, dated August 16, had previously given notice of the sailing of the schooner Theresa G., on the 14th, for Shieldsboro, Miss., and also that there was one case of yellow fever on board, which died August 16.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, SEPTEMBER 4, 1880. [No. 10.

ESSENTIAL ELEMENTS OF REGISTRATION.

Dr. E. Harris, secretary of the New York State board of health, and superintendent of the bureau of vital statistics, publishes the following as a concise statement of the elements of registration which are essential and obligatory:

Requirements for a perfect registry of a death, a birth, or a marriage should be clearly understood by all persons who have anything to do in making up the records which are registered as vital statistics; and it is desirable that no more should be asked for and entered in the public registers of birth, marriage, and death than is necessary for making the record so complete that each of the registered events (whether of birth, marriage, or death) shall correctly identify the individual and the essential facts in the record. While each of these three epochs in a human life should be so registered as to protect the rights of a personal and family record of each individual, the comparison of any two, or the three, of these separate but corresponding parts of the vital registry should completely verify each other in certain essential particulars, and with unfailing certainty identify the individual, the family, and the civil estate or social condition of the person. This may be best explained by viewing at one glance all the essential points in the public registration of a birth, a marriage, and a death. These few points, being *essential*, are justly regarded as *obligatory* in the certificates and returns that are registered in the bureau of vital statistics.

	Birth.	Marriage.	Death.
1	Name and date:	Names and date:	Name and date:
2	Birthplace and residence (of parents):	Birthplace, residence (and place):	Birthplace, residence. (and place):
3	Names and birthplaces of parents:	Names and birthplaces of parents:	Names and birthplaces of parents:
4	Sex, and race other than the white:	Other race than the white:	Sex, and other race than the white:
5	Paternal occupation:	Occupations:	Occupation (paternal, if an infant):
6	Parents' ages:	Ages:	Age:
7	Child's number in this family; —— by this mother?	Social estate ("état civil"):	Social estate ("état civil"):
8	Attestation of the event and its record:	Attestation of the event and its record:	Attestation of the event, its causes and the record:

Under the eight heads, as given in this view of the scheme of public registry, we arrange all parts of the record necessary for complete *identification* of the individual and the family. At the same time the full statements under these heads will supply the information which constitutes the science of vital statistics. All *forms of certificates* and all *methods* of returns and registry in the State system of vital statistics should be simple and comparable.

The report of the second year's work of the Sanitary Protection Association of Newport, R. I., is forwarded by Col. George E. Waring. A meeting was held July 27 and officers elected. The report condenses into two pages many valuable observations and suggestions concerning the sanitary conditions of cities and buildings, and the causes of defects in the latter.

SEMI-ANNUAL REVIEW OF THE MORTALITY IN PROVIDENCE, R. I., JANUARY–JUNE, 1880.

[By EDWIN M. SNOW, M. D., Superintendent of Health.]

The city of Providence has a location naturally healthy. The surface is quite uneven and the surface-drainage is excellent; natural water-courses opening into the bay give a free circulation of air into every part of the city. The population is not crowded, but generally the dwelling-houses are single and with unoccupied space about them. There is no underground population, and there are no large tenement houses. The population by the census of the present year is 104,862.

During the first six months of the year 1880 there were 1,094 deaths in Providence. Double this number, and it would give 2,188 as the mortality for the year. This would represent an annual rate of mortality of 20.86 in each 1,000 of the population, which is a slightly greater rate than the average for a series of years. It should, however, be remembered that in a long series of years, as shown by statistics in Providence, only 45.68 per cent. of the annual deaths occur in the first six months of the year. We may, therefore, conclude that the annual rate of mortality, as represented by the deaths in the first six months of the present year, is less than the actual rate will be for the year.

Sex.—Among the 1,094 decedents in the first six months of the present year were 524 males, 570 females, or 47.90 males and 52.10 females in each 100 decedents. This proportion of females is greater than the average among the decedents, as well as among the living population in Providence, as appears by the following figures:

Decedents, 1880, 47.90 males, 52.10 females in each 100; decedents, 24 years, 49.02 males, 50.98 females in each 100; population, 1875, 48.37 males, 51.63 females in each 100.

Color.—Of the 1,094 decedents in Providence from January to June, 1880, there were only 45 colored persons, a much less proportion of colored than the average.

Parentage—According to parentage, the 1,094 decedents in Providence during the first six months of 1880 were divided as follows: American parentage, 492, or 44.97 per cent.; Irish parentage, 419, or 38.30 per cent.; English and Scotch parentage, 105, or 9.60 per cent; German parentage, 21, or 1.92 per cent.; Other foreign parentage, 57, or 5.21 per cent.

By the census of 1875, the living population of Providence was 47 per cent. of American parentage and 53 per cent. of foreign parentage. This shows that the mortality is greater among the foreign than among the American population.

Locality.—The rate of mortality differs greatly in different portions of the city of Providence. Thus, during the first six months of the present year, the extremes of mortality were one death in 77.4 of the population in the tenth ward, and one death in 147.1 of the population in the second ward. Or, reducing the figures to the annual rate, the annual rate of mortality in ward ten was 25.83 in each 1,000 of the population, and only 13.59 in ward two.

This enormous difference in the rate of mortality does not, however, indicate any such difference in the natural healthfulness of the two portions of the city. It indicates rather the difference in the population of the two wards. In ward two the population is mostly American, living in dwellings comparatively favorable to health, and having a very small proportion of children. In ward ten the population is mostly foreign, and with a large number of children. Hence the relative difference in the mortality of the two sections.

Age of decedents.—Of the 1,094 decedents in Providence, in the first half of the present year, 362, or 33.0 per cent. of all, were under 5 years of age; 141, or 12.8 per cent., were between 5 and 20 years; 276, or 25.2 per cent., were between 20 and 50 years; and 315, or 28.5 per cent., were 50 years or over.

These proportions are somewhat different from those of the aggregate mortality for a series of years. In the total of decedents in Providence, for 23 years, the percentages were: Under 5 years, 37.9 per cent.; 5 to 20 years, 10.4 per cent.; 20 to 50 years, 26.9 per cent.; and 50 years and over, 24.7 per cent.

Causes of death.—Of the 1,094 deaths from January to June, 1880, there were 33 from accidental causes; 102 from diseases of the brain, including also apoplexy, paralysis, and convulsions; 34 from cancer; 26 from diarrhœal diseases, including enteritis; 152 from consumption; and 170 from tubercular diseases, including consumption, hydrocephalus, and tuberculosis; 171 from acute lung diseases, including pneumonia, congestion of the lungs, and bronchitis; 23 from fevers,

mostly typhoid; 30 from diphtheria; 59 from diseases of the heart; 18 from child-birth and puerperal diseases; 19 from diseases of the kidneys; 10 from diseases of the liver; 9 from croup; and 191 from scarlatina.

The specially prominent feature of the mortality during the last six months is the large number of deaths from acute lung diseases, scarlatina, and tubercular diseases. These causes produced 532 deaths, or nearly one-half of the whole number.

The deaths from consumption and other tubercular diseases were slightly above the average, but are not supposed to be increased or diminished by season or by epidemic causes.

The deaths from acute lung diseases (pneumonia, congestion of the lungs, and bronchitis) were considerably above the average, and seemed to be, to some extent, epidemic. There was, on an average, more than one death daily from these causes during the months of March, April, and May.

Scarlatina was severely epidemic during the whole six months, causing 191 deaths during the time, or more than one death daily on an average. The epidemic of scarlatina began in August, 1879, and during the twelve months from August, 1879, to July, 1880, inclusive, there were 394 deaths from this disease, in Providence. This number is considerably greater than was ever before known in Providence from scarlatina in any consecutive twelve months; and *I think is a greater number than was ever known, in a similar period of time, from any disease.*

At the present time (August) the disease still continues, but with a greatly-diminished number of cases and of deaths. The epidemic can hardly be considered as at an end; but the disease will probably increase, to some extent, as the weather grows cooler. We may, however, confidently expect a much less number of deaths from the disease during the coming winter than during the last.

ABSTRACTS FROM CONSULAR REPORTS.

Bombay.—United States Consul B. F. Farnham reports for the week ending June 22, 4 deaths from smallpox and 18 from other contagious diseases. Total from all causes 344, and 20 still-births in a population of 644,400. This would make the annual death-rate over 27 per 1,000, but the population given being that of the census of 1872, and considerable increase having taken place since, the rate obtained is too high. Sanitary condition improving; malarial fevers are the prevailing diseases; mean temperature, 86°.

Bradford, England.—United States Vice-Consul B. Richardson reports for the week ending July 31 a total of 59 deaths, being at an annual rate of 15.6 per 1,000. Among the causes of death were consumption, 12; acute lung diseases, 11; diarrhœa, 2; and scarlet fever, 1. There were 14 deaths under one year, 25 under 5 years, and 8 over 60 years of age. The number of births was 103, giving an annual rate of 27.2 per 1,000.

Buda Pesth, Hungary.—Under date of August 3, United States Consul Henry Stern writes concerning a case of cholera reported July 24 in the Pesther Lloyd. The case occurred in Southern Hungary, at the village of Szonta, on the railroad between Szegedin and Essegg, and near the river Drau, a branch of the Danube. Later advices, through the paper above quoted, report that the case had been thoroughly investigated by the authorities, and proved to be a genuine case of Asiatic cholera. The Hungarian paper states that the victim of the disease was a laborer on the railroad, died after an illness of three days, and that a *post-mortem* examination was made by the medical officers of the government. They declared the disease Asiatic cholera, and ordered disinfection of the station, cars, &c. No history of the case is given.

Cayenne, French Guiana.—Under date of July 7, the United States consul states that yellow fever last appeared in Cayenne November, 1876, and prevailed mostly among the troops and convicts till the end of July, 1877. During this time there were 134 cases and 38 deaths. Since then there has been no contagious disease in Cayenne. The mortality is stated at from 4 to 5 per cent. (40 to 50 per 1,000 per annum), which is not considered high, in view of the number of convicts, and of people coming from the interior, which is very unhealthy. The population is estimated at 12,000, of whom about 8,000 are permanent residents. The prevailing diseases are malarial fevers and dropsy. Weekly mean of thermometer 79°.

Constantinople.—United States Consul G. H. Heap, under date of August 6, forwards a report from Dr. Matteosian, who had been requested to investigate a rumored outbreak of cholera in certain villages on the Bosphorus. The report states that the rumors were in part false and in part exaggerated, as no case of true Asiatic cholera has been observed. There is no epidemic, but cases of "summer cholera" have been frequent, with some cases of dysentery. But very few deaths have occurred, the total mortality being about the same as for the corresponding season of last year, which was considered quite healthy.

The bulletin of epizootic diseases reports good health prevailing among the domestic animals up to August 3.

Havana, Cuba.—During the week ending August 21 there were 40 deaths from yellow fever, most of them among civilians. The American schooner *Theresa G.*, which sailed for Shieldsborough, Miss., on the 14th, had yellow fever on board while discharging at a foul and infected wharf. After leaving the wharf the vessel was thoroughly disinfected and cleansed before sailing. One man who had been sent to hospital while the schooner was at the wharf has since died of yellow fever.

Malta and Gozo.—United States Consul C. B. Eynaud reports 207 deaths for the two weeks ending July 31. Of these, 3 were from typhoid and 3 from typhus fever. Population 153,500; annual death-rate 35.1 per 1,000. Excepting diarrhœa among children, the health of the islands is very good. Mean temperature 86°.

Melbourne, Australia.—United States Consul O. M. Spencer forwards a report of mortality for the city and suburbs for the month of May. There was but 1 death from cholera; typhoid fever caused 21 deaths, and other contagious diseases 17. The total number of deaths was 391 in a total population of 265,000, or at the annual rate of 17.7 per 1,000. Mean temperature 58°.8.

Santa Cruz, Palma, Canaries.—United States Consul F. W. Lavers reports 13 deaths during the month of June, in a population of 6,070; annual death-rate 25.7 per 1,000. No causes of death noted.

Santander, Spain.—The population of the province is estimated at 235,300. The deaths were 513 for the month, giving an annual rate of 26.1 per 1,000; births 581, annual rate 29.6 per 1,000. There were 182 deaths under 5 years and 130 over 60 years of age. Among the fatal diseases were: Small-pox 2, measles 3, scarlet fever 10, diphtheria and croup 3, whooping-cough 9, typhus fever 22, dysentery 11, diarrhœa 2, puerperal fever 5, consumption 47, acute lung diseases 36, diseases of the brain 9.

In June there were 460 births, annual rate 23 per 1,000; deaths 399, annual rate 20.3. Deaths under 5 years 147, over 60 years 148. Causes of death: Measles 2, scarlet fever 2, diphtheria and croup 16, whooping-cough 7, typhus fever 19, dysentery 11, diarrhœa 23, puerperal fever 3, consumption 40, acute lung diseases 39, diseases of the brain 20.

Singapore.—During the month of May there were 316 deaths, of which "fever" caused 97, diarrhœal diseases 40, rheumatism 15, consumption 11, small-pox 1, and elephantiasis 3. General sanitary condition good, and no epidemic diseases noted at latest advices, July 12, 1880.

Sydney, Australia.—Reports for the month of May record 334 births and 160 deaths in a population of 76,159 (census of 1871). Annual birth-rate, 52.6 per 1,000; death-rate, 25.2. Including the suburbs, the population is 136,483, in which there were 739 births and 333 deaths; annual birth-rate, 64.9; death-rate, 29.2 per 1,000. In Sydney the deaths under 5 years were 53, or 33 per cent. of all deaths. Among the causes of death were, croup, 2; typhoid fever, 2; dysentery, 3; diarrhœa, 5; dropsy, 5; cancer, 4; consumption, 17; diseases of the brain and nervous system, 22; of the heart, 5; of the lungs, 20; of the digestive organs, 15; of the kidneys, 7; violent deaths, 17.

Vera Cruz, Mexico.—United States Consul S. T. Trowbridge reports for the month of July 79 deaths in a population of 20,000, being at an annual rate of 47.4 per 1,000. One death from yellow fever is noted. Mean temperature 89°. Deaths from consumption 15, diarrhœa 15, acute lung diseases 9, malarial fevers 5, whooping-cough 2. Of the 79 decedents, 73 were Mexicans, 5 Spanish, and 1 French.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Deposit, Broome County, N. Y.—Under date of August 21, Dr. Homer Law, United States Navy, writes that one death from "*cholera epidemica*" occurred in that village on the 20th; origin of the case unknown, and no other cases reported.

Erie, Pa.—Dr. E. W. Germer, health officer, under date of August 22, writes to deny emphatically the report in papers of the 20th announcing the appearance of Asiatic cholera in Erie. It appears that a physician of the city reported two cases by that name, which cases are declared by other physicians to have been sporadic cholera or cholera morbus. Dr. Germer states that no true cholera has been known in Erie since 1854, and that the present excitement and alarm are entirely groundless.

Erie, Pa.—The report of the existence of Asiatic cholera in this city has been contradicted by the health officer, Dr. Germer. Further investigation by Dr. D. H. Strickland, of the United States Marine Hospital Service, confirms the report of Dr. Germer, that the fatal cases were not Asiatic cholera, and that this disease cannot originate in the city, nor is it likely to spread if introduced.

EVANSVILLE, IND.—Dr. H. G. Jones, health officer, writes, under date of August 23, that for three weeks past typhoid and typho-malarial fevers have prevailed, and are now declared epidemic by the city board of health. All practicing physicians are required to report cases. The sewer system of the city is extensive, but, owing to the long-continued dry weather, there has not been enough water to flush the sewers.

EVANSVILLE, IND., August 23.—Dr. J. W. Compton writes that the typhoid fever appeared early in July and has continued to increase in extent and malignancy, the usual diarrhœa of enteric fever terminating in many cases, in exhausting hemorrhages from the bowels. Opinions differ as to the cause. Some ascribe the disease to local unsanitary conditions, others to atmospheric influences only. The city has suffered greatly for want of rain, the fall for eight weeks past having been insufficient to wash the surface or to cleanse the sewers, which emit offensive gases from the untrapped inlets at each street-crossing. While no portion of the city is exempt from the fever, it is less frequent ata distance from the sewers; and at the almshouse, just outside of the city limits, no case has originated among about 100 inmates. The mortality has not been great, compared with the number of cases.

NEW YORK.—Dr. W. M. Smith gives the following account of sickness on board the steamer *Clyde*, which arrived at quarantine on the 19th of August:

One man had been taken sick and died at sea; four others had been sick but recovered, and a fireman, named Frederick Sharron, was still very ill on arrival. Of the fatal case a very imperfect history was obtained. The captain said that the man died of *delirium tremens*. The physician was reticent, but said he showed evidences of "fever." The history of those who recovered was almost as unsatisfactory; they were consul's men. One of them still showed decided yellowness of the skin and eyes. They said they were first taken with pain in the back and frontal headache; they had no chills. The case removed to hospital was in many respects similar to the cases occurring on the *Colon* and *Acapulco* of this line, previously reported—congestion of the sclerotic and of the eyelids, a marked hemorrhagic tendency, as shown by epistaxis and by "coffee-grounds" ejections from the stomach: tongue red on the tip and margin, with a brownish coating in the middle; urine scanty and slightly albuminous. I have seen no cases more characteristic of yellow fever than those we have had from the Aspinwall steamships, in which list I include the cases from the *Acapulco*, previously reported. An autopsy in the case of Arthur Lies, from the steamship *City of Vera Cruz*, reported as a case of yellow fever, gave the following results: *Kidneys*, not much congested; no interstitial nephritis; granular matter in the tubules of the cortex and pyramids. These granules consist chiefly of fat, albuminoid particles and epithelial *débris*. Some of the tubules contain this granular matter, while in places their own epithelium appears normal. A few hyaline casts are seen at the apex of the pyramids. *Liver:* superior surface has a yellowish tinge; inferior, a dark brown color; one section is found to contain fat and pigment. Fat is found mostly near the portal vein, while the pigment is distributed around the hepatic radicles. There is also dilatation of these central vessels, and atrophy of the cells around them. There is no interstitial lesion nor morbid congestion. *Spleen:* the organ is intensely congested, and in places the tissue is broken down by extravasation of blood: the spleen corpuscles appear normal.

SAVANNAH, GA.—Dr. J. T. McFarland, health officer, under date of August 21, writes at the request of the board of sanitary commissioners, to call the attention of the National Board of Health to the form used in the BULLETIN for reporting the death-rate of certain cities. The commissioners complain that the death-rate of the white and colored populations combined appears prominently in the table, for Savannah and other Southern cities, while the separate death-rates for the two races, as given in the subjoined note, are easily overlooked. The result is stated to be injurious to the sanitary reputation and to the material interests of such cities as have a large colored population, and a change in the form of recording the reports is requested.

It will be observed that this request has at once been met by substituting for the foot-note a supplementary table (No. 9 of the BULLETIN), which will clearly exhibit the relative populations, number of deaths, and rates of mortality, in all cities having a considerable colored population.

The causes assigned by Dr. McFarland for the high death-rate among the colored people generally, coincide with those given in the review for July (BULLETIN No. 9), and in previous monthly reviews. Overcrowding and bad condition of habitations, improvidence and inattention to hygienic rules, and failure to avail themselves of the medical service offered free by the city, are especially mentioned. In Savannah the hospital for indigent colored people is permitted to be a place of refuge for many who are not strictly patients, and medical attendance for the poor is liberally provided for by the city. Yet from July 18 to August 21, eighty-seven burial certificates were issued to persons dying without medical attendance. In such cases, the health officer investigates the case and gives the certificate.

Phœnixville, Pa., 6,692; deaths, 3; under 5 years, 2; diarrhœa 2, enteric fever 1. Pleasant Hill, Miss., 253; no deaths. Port Royal, S. C., 750; diphtheria 1. Portsmouth, Ohio, 2,320; deaths, 4; under 5 years, 1; consumption 1, diarrhœa 1, enteric fever 1. Rensselaer, Ind., 900; diarrhœa 1. Ripley, Miss., 1,000; no deaths. Rock Island, Ill., 12,000; deaths, 4; under 5 years, 2; diarrhœa 2, malarial fever 1, old age 1. Rockland, Me., 7,500; deaths, 5; under 5 years 1, consumption 2, diarrhœa 1, old age 1. Springfield, Ohio, 21,000; deaths, 4; under 5 years, 2; scarlet fever 1, puerperal fever 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 4. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 3; old age 1. Waxahachie, Texas, 2,000; no deaths. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; diarrhœa 2, under 5 years. Youngstown, Ohio, 15,089; deaths, 3, under 5 years; diarrhœa 2, pneumonia 1. Total population, 396,878; deaths under 5 years, 51; total number of deaths, 127; annual rate per 1,000, 16.7.

DUBLIN, IRELAND.—The report of the medical officer of health shows an average death-rate of 33.4 per 1,000 per annum. On the northern side of the city the rate was 36.9, and on the south side only 31.3 per 1,000. Smallpox caused 45 deaths; whooping-cough, 37; measles, 26; scarlet fever, 43; fevers, 27; diarrhœa, 16; diphtheria 1, and all other zymotics 35, making a total of 230 from zymotic diseases. In the hospitals 337 patients were admitted with the following diseases: Smallpox, 156; typhus fever, 45; typhoid fever, 25; scarlet fever, 82; measles, 29. Measles has been epidemic in Dublin for a long time, and measures of prevention have been used with good effect. Inspection of houses reported as unhealthy, and improvement in their condition and construction, has been attended with much benefit to public health.

HAVANA, CUBA.—Advices of August 18 state that the British bark R. W. Wood, on which yellow fever appeared while on the voyage to Mobile, entered the port of Havana June 19, and went to a wharf of the Regla sugar storehouse, on the opposite side of the bay from Havana, to discharge cargo. From this point there is frequent and easy communication by steam ferry with the city. The vessel was there during her whole stay of twenty-two days, and was towed from that place directly to sea July 13. On the 8th of July the captain stated that his vessel was discharged, and he hoped to sail on the 10th. He was advised to have his vessel thoroughly cleansed, and she was fumigated July 9, with the understanding that she was to sail the next day. Fifty pounds of the sulphate of iron were also furnished, with instructions for its use in the bilge, &c. The vessel was detained four days after the fumigation, and it is said that the captain never slept on board during that time. The vessel lying at the wharf, the crew had ample facilities for visiting the city, where there is reason to believe they frequented the infected portions and contracted yellow fever before sailing. No measures of purification applied to the vessel could protect a crew so exposed to contagion on shore.

SPAIN.—The Monthly Bulletin contains reports from 49 provinces, with an aggregate population of 16,658,936, for the four weeks ending June 27, 1880. The total mortality being 31,017, the annual death-rate was 24.3 per 1,000. The principal causes of death were: Smallpox 689, scarlet fever 183, diphtheria and croup 561, whooping-cough 586, typhoid (enteric) fever 310, typhus fever 479, measles 961, consumption 1,633, acute lung diseases 3,057, and diarrhœal diseases 3,235. There were 344 deaths from accidents, 60 suicides, and 75 homicides. In comparing this and other European reports with those of the United States, the most conspicuous point of difference is the comparative absence of typhus fever in this country, where it is so rare as to give no appreciable death-rate for the whole population.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, SEPTEMBER 11, 1880. [No. 11.

REPORT ON THE SUBJECT OF ORGANIC MATTER IN THE AIR.

At the request of the National Board of Health, I undertook about a year ago an investigation on the best method for the detection and determination of the nature of the organic matter which is well known to exist in the air. I was perfectly conscious, at the outset, that very grave difficulties would be encountered in the course of such an investigation, and it seemed to me somewhat doubtful whether much of value could be established without the expenditure of a vast amount of labor—much more than was contemplated by the board or by myself. After due consideration, however, I began the work in the hope that, though the results reached might not be quite satisfactory, something more than is at present known might be learned concerning the subject under examination. Its importance seemed to warrant the attempt. The work has been prosecuted, with some brief necessary interruptions, throughout the academic year, and I herewith have the honor to submit to the board a report on the results reached. A preliminary report, giving an outline of the work, and not including any details in regard to the methods employed, has already been presented to the board, and published in the "National Board of Health Bulletin" for January 31, 1880. The present report will include, not only the details of the experiments referred to briefly in the published statements, but also of additional experiments, performed since the time of the first writing, with the object of more fully establishing the correctness of the conclusions first drawn, or of gaining new light upon the subject under investigation.

While I cannot claim to have added very much to the subject, I think it will be seen that greater exactness has been introduced in the methods of investigation than heretofore, and that the future possibilities are brought out more clearly. A firm basis for future work has been gained; some facts of permanent value have certainly been established; and, if the solution of the problem has not been reached, some, if not most, of the blame should be attributed to the nature of the problem itself. The work requires the greatest amount of patience and the greatest amount of skill. Without a combination of these two qualities the results reached would have no value. It has been my good fortune to have associated with me, at successive periods of the investigation, two gentlemen excellently qualified for the work, both thoroughly trained chemists, both conscientious, and gifted to an unusual extent with patience. I here desire to acknowledge my obligations to Mr. W. Mager and Mr. T. W. Day, who have acted as my assistants, and to whose zeal and industry much of what has been accomplished is due.

Introduction.

"Pure air" and "impure air" are expressions which carry with them but vague meaning. Air may, of course, be rendered impure in a great variety of ways, and produce upon those who breathe it an equal variety of effects. The most frequent kind of contamination of air is that which results from bad ventilation of apartments which are occupied by living beings, and every one has experienced to a greater or less extent the effects of this kind of contamination. For a long time it was thought that the bad effects produced by such air were due to the abnormal quantity of carbonic acid or carbon dioxide introduced by the breathing process, and this gas has been regarded as one of the most common enemies of mankind. Books have been written on the subject, and the popular mind is still thoroughly imbued with the idea that carbonic acid is the injurious constituent of the air of badly ventilated apartments. Many medical books, and even some which are specially devoted to chemistry, still serve to spread this idea. But it has been conclusively shown that carbonic acid may be introduced into air, otherwise pure, to a much greater extent than it is commonly introduced by the breathing process, even under the most adverse conditions of ventilation, without producing the characteristic effects of impure air, or indeed any disagreeable effects whatever. And Pettenkoffer has shown that the really injurious constituents are in all probability the refuse organic matters which are given off from the body, together with carbonic acid. These are in a condition of decomposition, and, if taken back into the system again, it is natural that there should be a more or less serious disturbance of the vital phenomena.

In order, then, to form an estimate of the purity or impurity of air, we ought to be able to determine the amount of the really injurious constituents present in it—*i. e.*, of the organic matters. It is well known, however, that the method usually employed for the purpose of testing the purity of the air consists in determining the amount of carbonic acid present. If the impurities are introduced by the breathing process the latter method is certainly of value, for it may be assumed that the proportion between the amounts of organic matter and of carbonic acid given off from the body is pretty constant; and hence, if we know the amount of carbonic acid present, we can draw a conclusion with reference to the amount of the organic matter, or rather with reference to impurity of the air.

Still there are circumstances under which the determination of the amount of carbonic acid in air would fail to give the information we desire, and, even under ordinary circumstances, it would be better if it were possible to determine directly the amount of the injurious constituents. It is believed, for instance, and apparently with justice, that the air of our dwellings and of other buildings is, in some way, very frequently contaminated by the gases arising from imperfect sinks and water-closets. It would plainly be impossible to determine the extent of the impurity thus introduced by the same method as is used for air contaminated by the process of respiration. For this purpose we need a method which shall enable us to determine directly the amount of the organic matter, and every one will at once recognize the importance of having such a method at our command. This need has been felt for some time, and attempts have been made to supply it, though these have not been very successful. It is not proposed to give here a *complete* historical sketch of the attempts that have been made from time to time, but the principal ones demand attention.

Historical sketch.

One of the first serious investigations on the subject under discussion which requires consideration here was undertaken by Dr. R. Angus Smith. His results are embodied in papers which appeared in the *Journal of the Chemical Society*, vol. xi, p. 217, *Chemical News*, 1870, and in a work entitled "*Air and Rain*" (London, 1872). Smith first endeavored to collect the organic matter by passing the air through water. In regard to this he says: "If air be passed through water a certain amount of this material (the organic matter) is obtained, but I have found it difficult to pass a sufficient quantity through. If it is made to pass rapidly, *absorption does not take place*, and evaporation of the water is the consequence; if it passes slowly, it requires several weeks to pass a hundred cubic feet through a small quantity of water. I continued the experiment for three months, but although I obtained sulphuric acid, chlorine, and a substance resembling impure albumin, I did not get enough to make a complete examination, and indeed this could not be expected, as I found that in that time less than one hundred gallons had passed through."

Finding this method of collecting impracticable, the author later describes another in these words: "A bottle of the capacity of about 2,000 cubic centimeters, or nearly two quarts, was filled with the air to be washed. This was done by means of a pump of the capacity of about a tenth of a cubic foot of a flexible material."

"The tube from the flexible pump in a closed state is put into the bottle, the mouth being left open, so far as the tube permits it. The pump is then drawn open, and the fresh air rushes into the bottle. The bottle contains 30 to 50 c. c. of the purest water. This is shaken with the air. Of course the tube is previously drawn out and the glass stopper put on. It is very important that the water should be pure." . . . . "Patience is not lost in excessively careful preparations for experiments of this kind." . . . . By experiment Smith found that one stroke with the pump, whose volume is twice as large as the volume of the bottle, is sufficient to refill the bottle. For determinations of the organic matter he fills it with bad air ten times; with good air *a hundred*, and in some cases even *a thousand times*.

This latter method certainly calls for a great amount of patience. Its tediousness is almost sufficient to exclude its use as a practical measure. It is not stated in Smith's papers whether the air that had been shaken with water was subsequently examined for organic matter or not; and it is questionable whether complete absorption can be effected in this way. From subsequent statements made by Smith it seems clear that if the air be drawn through a number of vessels and tubes for the purpose of securing complete absorption a considerable quantity of the substances which it is desired to obtain remains in contact with the walls of the glass vessels and tubes.

At first Smith confined himself to the action of the air under examination on a dilute solution of potassium permanganate. He noticed very marked differences in the effect produced upon the solution by air of different degrees of purity, and showed that, in general, the

purer the air the less reducing action does it exert upon the permanganate. The presence of nitrous acid and sulphurous acid, in city air especially, interferes very decidedly with the value of the permanganate test, and, though Smith is at first enthusiastic in regard to this test, he afterwards practically abandons it, preferring to determine only the nitrogenous material in the water after the absorption of the organic matter.

In 1872 Moss published (*Lancet*, p. 627) a paper "On the Estimation of Nitrogenous Organic Matter in Air." He passed the air through wash bottles containing pure water, and then examined the solutions thus obtained, according to the usual method for determining the amounts of free and potential ammonia.

In view of Smith's remarks on the use of wash-bottles, Moss's own description of his experiments would appear to condemn them as of little value, and it is, at least, surprising to learn that "in the whole of the experiments the quantity of air passed through the aspirator is corrected for temperature to 0° c. and for pressure to 30 in. barometer. Very little that is new is added to our knowledge of the subject by Moss's experiments, but they seem to indicate marked variations in the amounts of nitrogenous matter present in the air under different circumstances, and, in this respect, they confirm the results of Smith. The external air at Portsmouth contained, according to Moss, in a cubic meter an amount of combined nitrogen varying from 0.072 milligram to 0.274 milligram, while air taken from a hospital ward contained 1.542 milligrams, and that from a men's privy 1.133 milligrams in a cubic meter.

The sanitary department of Glasgow, under the direction of Dr. James B. Russell, medical officer of health, has for some time past published monthly reports on the air of the city. These reports are prepared by the chemist of the department—first, E. M. Dixon, B. Sc., and at present Wm. J. Dunnachie. Mr. Dixon devised a method for extracting the objectionable constituents from the air, which may be described in a few words: The air is drawn through three glass vessels, called absorbers, "about 7 inches long and 2 inches diameter, each of which is fitted with an india-rubber cork having two perforations for the insertions of glass tubes." Through one of these perforations in each cork a tube passes nearly to the bottom of the absorbers and there terminates in a flattened bulb around the outer edge of which a row of minute holes is drilled by a lapidary. The absorbers are connected by glass tubes which pass through the second opening of each cork. "To the last of the series of bent tubes an india-rubber pipe is attached, which communicates with the "inlet" of an ordinary gas-meter, registering from 0.01 to 1,000 cubic feet. The outlet of this meter opens into a cylindrical receiver, with which all the other meters of the station in a like manner communicate. A ½-inch lead pipe passes from the receiver, and is attached to the aspirator, which is in connection with the water main."

One series of the absorbers is used for the ammonia and albuminoid ammonia. In order to effect complete washing of the air a measured quantity of perfectly clean glass beads is placed into each glass, and the "rose," or perforated end of the glass tube, placed in position among the beads. "Each set of 'absorbers' is kept out twice for a period of forty-eight hours and once for one of seventy-two hours in each week. When returned, the tubes and absorbers are disconnected in rotation, emptied, and thoroughly washed with distilled water."

The work done at Glasgow seems to be rather more systematic, and entitled to correspondingly more weight, than that done at most other places. It seems, however, justifiable to object to the use of a series of vessels such as is there employed. Smith's experiments prove that the use of complicated vessels, of which a considerable amount of surface is exposed, is fatal to accuracy and, although the errors in the Glasgow experiments must be very nearly constant, it is highly desirable to find a method involving simpler vessels.

At the observatory of Montsouris, near Paris, elaborate examinations of air are made, as well as at Glasgow. The method of washing the air is similar to that employed at Glasgow, though it appears, in some respects, to be somewhat less perfect. One modification deserves mention. The piece of the apparatus which corresponds to the "rose" of the Glasgow apparatus above described is made of platinum. Determinations are made of the ammonia and albuminoid ammonia.

It will thus be seen that the subject under discussion has seriously claimed the attention of those interested in the problems of sanitary science, and a great deal of time has been spent upon it.

New experiments on collecting organic matter from the air.

In beginning actual work it was first considered necessary to devise a more perfect method for the collection of the nitrogenous organic matter than had yet been described. A suggestion made by Chapman (*Chemical News*, 1870, p. 65) was taken advantage of, and, with the aid of some modifications, a very satisfactory and simple method was perfected after considerable work. Chapman used finely-powdered pumice-stone placed on a layer of coarser pumice-stone on wire gauze in a funnel. The material was first heated to redness and, before the air was drawn through, it was moistened with a little water. He says that he found this method satisfactory, though I have been unable to find a description of any experiments which furnish proof of its accuracy.

It seemed desirable to diminish, as much as possible, the surface of the absorbing material directly exposed to the air, and to increase the thickness of the mass through which the air was to be passed, so Chapman's apparatus was modified by using, instead of the funnel, a tube of three-eighths inch internal diameter, and from 5 to 7 inches long. This was drawn out at the lower end, so as to accommodate a small piece of rubber tubing, and in this form it is ready for use. After being carefully washed, it is filled with ignited pumice-stone. Experiments were at once undertaken to test the efficiency of the apparatus, and, as these yielded very satisfactory results, it may be best to describe here in detail the method of work.

Preparation of the Reagents.—As in all the experiments which form the basis of this report the object primarily sought for is the determination of very minute quantities of material, it is above all necessary at the outset to procure absolutely pure reagents, or, at least, to determine with the greatest accuracy the amount of impurity in the reagents used.

1. The *water* was carefully distilled, and then steam was passed through this for some time. Water thus prepared did not give the slightest evidence of the presence of ammonia when treated with Nessler's solution. If, however, 500 c. c. of this water were distilled through a carefully cleaned condenser, the first 100 c. c. of the distillate gave a slight test for ammonia. It might be thought that this ammonia came from the walls of the glass condenser or the connections, but this is apparently not so. For, if the distillation of a given specimen be continued until the distillate ceases to give the ammonia test, and a fresh specimen of the purified water be then distilled immediately through the same condenser, the first portions of the distillate give the same test as in the first instance. It seems indeed almost, if not quite, impossible to get water absolutely free from ammonia. This fact need not, however, interfere with the accuracy of subsequent determinations, for it is easy to determine the amount of ammonia which is given off from the purified water, and then to subtract this amount from the total found in the experiment. This was done in every case. Of course a considerable quantity of water may be purified at one time and kept carefully protected from the air for future use. If a determination of the amount of ammonia given off from 500 c. c. of this water is made, then it will be known how great a correction must be made in determinations made with this water.

2. The *standard ammonia solution* was prepared from pure ammonium chloride. The salt was purified by sublimation and finally by re-crystallization. 3.147 grams were dissolved in a litre of water (purified as above), and 50 c. c. of this concentrated solution were then diluted to one litre, so that one c. c. of the dilute solution corresponded to 0.00005 gram $N\,H_3$. This solution was used throughout the experiments.

3. *A solution of caustic potassa* was made by dissolving 400 grams of stick caustic potassa (Merck's, purified by alcohol) in water, and diluting the whole to one litre, so that 1 c. c. contained 0.4 gram KO,H. This solution was boiled for some time to drive off any ammonia contained in it.

4. A *solution of sodium carbonate* was prepared by dissolving 500 grams of the pure crystallized salt, $Na_2CO_3+10H_2O$, in water, and diluting to one litre, then boiling as before to drive off any ammonia present. 1 c. c. of this solution contains 0.5 gram $Na_2CO_3+10H_2O$.

5. *A solution of potassium permanganate* was prepared by dissolving 8 grams of $KMnO_4$ in water, and diluting to one litre, then boiling as before. 1 c. c. contains 0.008 gram $KMnO_4$.

6. The *pumice-stone* used in the absorbers was prepared by coarsely powdering the ordinary material, then sifting to get rid of the fine powder, then bottling that portion which consisted of pieces about the size of duck shot. The fine powder is objectionable on account of the bumping which it is pretty sure to cause when brought into water and distilled. The material as described is capable of absorbing nitrogenous matter from the air, as thoroughly as finer powder. Before each experiment the pumice-stone to be used should be heated to redness in a platinum crucible for some time. When filled into the carefully-cleansed absorbing tubes the mass should be moistened with a little water.

In addition to the materials described above, a Nessler's solution is, of course, necessary for the estimation of the ammonia. This is prepared according to the ordinary directions.

Method of experimenting.—In order to make the determinations of the amounts of free and albuminoid ammonia obtainable from the organic matter of the air, the air to be examined is first drawn through the pumice-stone absorber by means of an appropriate aspirator. The volume of air necessary for a determination varies, of course, according to the amount of impurity. Usually from 50 to 100 litres were drawn through. After the absorption is completed, the pumice-stone is brought into a flask perfectly cleaned with the purest water and 500 c. c. of the same water and 5 c. c. of the sodium carbonate solution added. Connection is made with a clean condenser, and 100 c. c. distilled off (distillate A) and put aside in an appropriate vessel for treatment with Nessler's solution. A small amount of the distillate may be collected beyond this point and tested for ammonia, but it will usually be found to contain none.

Twenty c. c. of the potassium hydroxide solution and 50 c. c. of the permanganate solution are added to the contents of the flask, another 100 c. c. distilled off, and the distillate (distillate B) put aside.

Distillate A is now Nesslerized, and, after the necessary correction is made, the amount of ammonia found represents the *free ammonia*. Distillate B in like manner gives the *albuminoid* ammonia in the volume of air drawn through the absorbers. The results may then be made comparable with others by calculating for a given volume of air. The quantity of ammonia derived from the organic matter is usually stated *in milligrams in a cubic meter* of air, or *in grams in a thousand cubic meters*. The quantities given in this paper are according to the latter standard.

Unless special precautions are taken, great inconvenience, if not the destruction of the glass vessel used in the distillation, is caused by bumping. This can be prevented almost entirely by heating the flask quite slowly before beginning the distillation, and not allowing the flask to cool during the process of distillation. The solutions of potassium hydroxide and of the permanganate should also be hot when added.

If all the directions above given are carefully followed, no difficulty is experienced in making the estimations; though it will be seen that the great number of precautions necessary make the work very tedious.

Experiments to determine the efficiency of the pumice-stone tube.—The absorber having been prepared as above described, air was drawn through it, and then through four wash-bottles. 91.5 litres of air were drawn through in the first experiment. In each of the wash-bottles there were 50 c. c. water, and in the first one there were further 5 c.c. dilute hydrochloric acid. The time occupied in drawing the air through in this experiment was ten hours. On now bringing the pumice-stone in water and distilling as above described with the necessary reagents for the purpose of determining the entire quantity of ammonia obtainable from the collected material, an amount corresponding to about 0 3 gram in 1,000 cubic meters of air was found. On examining the wash water contained in the four flasks, only the quantity of ammonia known to be present originally was found. Then the air was passed successively through two pumice-stone tubes, and, while the first yielded a considerable quantity of ammonia, the second did not yield even a trace. After this, air drawn through a vessel containing decaying meat was used, the experiments otherwise being exactly like those just described. Three pairs of parallel experiments were performed and these gave the quantities of ammonia stated below, calculated for 1,000 cubic meters of air:

Series.	First experiment.	Second experiment.
	Gram.	*Gram.*
A	0. 457	0. 45
B	0. 608	0. 527
C	1. 092	1. 153

The wash water in the three flasks used in each experiment was now examined, and again only the original quantity of ammonia was found. It is thus shown conclusively that the pumice-stone tube is an efficient absorber of the nitrogenous organic matter contained in the air. As regards the rapidity with which the air is drawn through the absorber, it seems to make very little difference what the rate is. A number of experiments were performed to test this. The rate of passage was varied between ten litres in two hours and the same amount in forty-five minutes. In all cases, however, no ammonia was obtained from absorbents placed between the first pumice-stone tube and the aspirator.

The *absorber* employed in these experiments can then, I think, be recommended as the best thus far used. It is simpler than that introduced by Dixon at Glasgow, or that used at Montsouris, and, at the same time, while accomplishing everything which is expected of the two forms mentioned, it is free from what appears to me to be a very serious objection to these, viz, the exposure of a considerable glass surface to the action of the air under examination. The new absorber is shown to collect all the nitrogenous matter, and there is no reason to doubt that the pumice-stone gives up all the nitrogen again when distilled with the proper reagents. The unqualified recommendation of the apparatus which I am able to give is founded upon a very large number of experiments which need not be described individually here. One was but a repetition of those which preceded it, with the exception of some minor modifications, and, as the figures actually obtained furnish but little proof of the accuracy of the work, they may be omitted.

Parallel experiments to determine the reliability of the results.—Having shown that the nitrogenous matter can be completely absorbed by the pumice-stone, the next question to be answered was, whether the results obtained can be depended upon? Will the method employed always give the same results when applied under the same circumstances? As far as I can learn from the literature of the subject, very little, if any, effort has thus far been made by experimenters in this field to determine the reliability of the different methods employed. As the air in any place is likely to undergo change from day to day, it is plain that the only way to test any given method fairly is to *examine at the same time specimens of the same air*, so that parallel experiments were always carried on. Sometimes, indeed, three experiments with the same air were carried on at the same time for the purpose of more thorough verification.

At first the total amount of ammonia was determined, and afterwards determinations of the free and albuminoid ammonia were made. Here I shall confine myself to the first experiments. In all cases the amounts stated correspond to 1,000 cubic meters of air.

External air, taken from a height of about 25 feet above the ground, was drawn by means of aspirators in the usual manner through pumice-stone tubes.

Series.	First experiment.	Second experiment.	Third experiment.
	Gram.	*Gram.*	*Gram.*
A	0 343	0. 361	0. 439
B	0. 457	0. 45	
C	0. 608	0. 527	
D	1. 092	1. 153	

A number of other experiments were performed of the same kind as those above considered, and these yielded practically the same results; that is to say, the agreement between the results obtained in parallel experiments was in no case poorer than that observed above. If we remember what extremely small quantities of matter we are here dealing with, the agreement must be regarded as fairly satisfactory, so that the method may without doubt be used with advantage whenever it is desired to obtain information in regard to the total amount of nitrogenous or ammoniacal matter contained in the air.

Are all organic matters retained by the pumice-stone?—While the pumice-stone absorber enables us to collect and estimate the amount of nitrogenous matter in the air, the question remains open whether there are not other organic matters not containing nitrogen which may pass through the absorber? To test this point, contaminated air was drawn through pumice-stone and then through a flask containing a very weak solution of potassium permanganate. If organic matter passes through the absorber the effect ought to be shown upon the permanganate solution. The result of the experiments in this direction was to show conclusively that something passes through the absorber which exerts a reducing action upon the permanganate, and previous experiments have shown that this is not nitrogenous. The entire unreliability of the permanganate method for determining the quantity of organic matter present prevented the making of any quantitative experiments, but some experiments were performed for the purpose of discovering approximately the proportion existing between the non-nitrogenous oxidizable material and the nitrogenous. Air from the same source was passed at the same time: 1st, through pumice-stone and a weak solution of permanganate; and 2d, through a permanganate solution alone of the same amount and same strength as in the first experiment. The amount of air which was freed from nitrogenous material by the pumice-stone required to decolorize the permanganate solution was then noted, and the amount of air not passed through pumice-stone required to accomplish the same result. The results reached in these experiments were not satisfactory, but they showed that, as would naturally be expected, the air from which the nitrogenous material had not been removed contained more oxidizable material than that which had been passed through the pumice-stone. They throw no light whatever upon the important question, whether the non-nitrogenous oxidizable material is injurious or not; and until this question is answered, it will be impossible to say how much weight should be attached to determinations of the nitrogenous constituents as a means of judging of the purity of the air. It is undoubtedly true that at present we possess no method that can give more than a faint intimation of the presence of non-nitrogenous organic matter in the air, and if these could be shown to be injurious, we should be in a sorry plight indeed, as far as our power to determine the amount of impurity is concerned.

Reliability of the results obtained in determining ammonia and albuminoid ammonia.—After the collection of the material from the air, the problem of its examination becomes very similar to that of the examination of the organic matter in water. It is known that great differences of opinion exist among those who have worked on the latter problem, and it can safely be said that up to the present no satisfactory conclusion has been reached. It is not necessary to enter into the discussion as to the relative merits of the different methods which are in use or which have been recommended for the determination of organic matter in the air. It is plain that it is not of so much importance to sanitarians to know the total amount of organic matter, that is, matter containing carbon, in the air, as to know the amount of those particular organic matters which are most likely to be injurious. These are commonly supposed to be nitrogenous, on the assumption that they are derived from animal substances which nearly always contain nitrogen.

The *albuminoid ammonia* process, as developed by Wanklyn, Chapman, and Smith (*Journal Chem. Society*, N. S., vol. v, p. 591; Wanklyn, *Water Analysis*, fourth edition, p. 25), has attracted a great deal of attention, and has been extensively used. As is well known, this

process depends upon the fact that many nitrogenous organic substances give up their nitrogen in the form of ammonia when treated with potassium hydroxide and permanganate. If we then have a mixture of substances consistiog, on the one hand, of ammonia or volatile ammoniacal bases (ethylamine, methylamine, etc.), and, on the other hand, of various nitrogenous organic substances, containing nitrogen in different forms of combination, we can distinguish between the two kinds of substances. The original mixture is treated with sodium carbonate, and water, and the ammonia given off under these circumstances is classed as *free ammonia*. On then treating the residue with potassium hydroxide and permanganate a new portion of ammonia is given off. This is classed as *potential* or *albuminoid ammonia*.

I will here call attention to experiments undertaken to decide whether this method gives concordant results when applied to the examination of the material collected from the air in the pumice-stone absorber. A large number of parallel experiments was performed for this purpose. The results of some of the typical are here communicated.

First series. (*Laboratory air.*)

1st experiment—Free ammonia	0.37	gram.
Albuminoid ammonia	0.28	gram.
2d experiment—Free ammonia	0.36	gram.
Albuminoid ammonia	0.36	gram.

Second series. (*Air through decaying meat.*)

1st experiment—Albuminoid ammonia	0.45	gram.
2d experiment—Albuminoid ammonia	0.50	gram.

Third series. (*External air.*)

1st experiment—Free ammonia	0.120	gram.
Albuminoid ammonia	0.345	gram.
2d experiment—Free ammonia	0.073	gram.
Albuminoid ammonia	0.457	gram.

Fourth series. (*External air.*)

1st experiment—Free ammonia	0.128	gram.
Albuminoid ammonia	0.215	gram.
2d experiment—Free ammonia	0.120	gram.
Albuminoid ammonia	0.241	gram.
3d experiment—Free ammonia	0.157	gram.
Albuminoid ammonia	0.292	gram.

Fifth series. (*External air.*)

1st experiment—Free ammonia	0.067	gram.
Albuminoid ammonia	0.093	gram.
2d experiment—Free ammonia	0.064	gram.
Albuminoid ammonia	0.14	gram.
3d experiment—Free ammonia	0.07	gram.
Albuminoid ammonia	0.08	gram.

Sixth series. (*External air.*)

1st experiment—Free ammonia	0.103	gram.
Albuminoid ammonia	0.051	gram.
2d experiment—Free ammonia	0.09	gram.
Albuminoid ammonia	0.05	gram.
3d experiment—Free ammonia	0.074	gram.
Albuminoid ammonia	0.041	gram.

Seventh series. (*Air contaminated by breathing.*)

1st experiment—Free ammonia	0.287	gram.
Albuminoid ammonia	0.339	gram.
2d experiment—Free ammonia	0.220	gram.
Albuminoid ammonia	0.309	gram.

Eighth series. (*Laboratory air.*)

1st experiment—Free ammonia	0.0793	gram.
Albuminoid ammonia	0.440	gram.
2d experiment—Free ammonia	0.075	gram.
Albuminoid ammonia	0.42	gram.

Ninth series. (*Laboratory air.*)

1st experiment—Albuminoid ammonia	0.22	gram.
2d experiment—Albuminoid ammonia	0.195	gram.

The results recorded above will, I think, serve to give a fair idea of the accuracy of the method involved; and it will be seen from them that, in determinations of the organic matter made in one and the same specimen of air, there is liability of considerable variations, due, as it seems, to the imperfection of the method. The results obtained, then, cannot be regarded as accurate or anything like accurate, but, at the same time, the method is capable of showing changes in the amount of nitrogenous organic matter when these are considerable. The difference between ordinary impure air and pure air can easily be detected, but slight variations, such as may take place from day to day, of a fairly pure atmosphere can hardly be determined with any degree of confidence.

Variations produced in the amount of nitrogenous organic matter in air by different causes.—After having succeeded by long continued labor in getting a satisfactory method for the determination of the ammonia and albuminoid ammonia obtainable from the nitrogenous organic matter of the air, the next step in the inquiry was the examination of air purposely contaminated by different causes. I regret that the amount of time necessarily spent on the first part of the problem, *i. e.*, the devising and testing of the method, was so great as to leave very little for a study of its applications to practical cases. But it may be said that the whole subject is now in such condition that these applications can be made comparatively readily, and at the close of this report suggestions will be made with reference to the study of the air by the perfected methods.

1. *Decaying meat* was first employed as a means of contamination. Meat in active decomposition, and giving off an unendurable odor, was placed in a bottle with a little water, and air drawn through this bottle in such a way as to cause *constant bubbling of the water*. Special precautions were taken to secure complete absorption, but it was found that at least all the *nitrogenous material* was absorbed by one pumice-stone absorber. The air freed from nitrogenous material still possessed a very disagreeable odor, and would certainly be instinctively avoided by any civilized human being. Several experiments of this kind were performed and always with the same result, *i. e.*, there was not found an excess of albuminoid ammonia over that ordinarily found in the open air. The amounts in some cases were indeed less than is frequently found in external air.

Now this unexpected result may be interpreted in two ways. If we assume that the air which was passed through the bottle with the decayed meat was unfit for breathing purposes, and we can hardly avoid this assumption, if we take the horrible odor into consideration, then, as no excess of albuminoid ammonia was found, the conclusion would naturally follow that the amount of albuminoid ammonia found in air is not a measure of the organic impurities, a conclusion which is plainly of the very highest importance in this connection.

Again, if we assume that albuminoid ammonia *is* a measure of the organic impurities of the air, then it would follow that the organic matter is effectually retained by the water.

In a paper read before the Philosophical Society of Glasgow, February 18, 1880, Dr. Neil Carmichael briefly discusses the question here suggested. The subject of the paper is "The trap and water-closet system and the relations of the same to sewage products, gaseous and other." He refers to some air analyses published in the reports on the air of Glasgow by the sanitary department, and finds that air a few feet over the Clyde, under the Broomielaw bridge, is rather more free of impurities than the air taken from the city, that is, it contains less organic matter. Still the water of the Clyde at the same point, on being analyzed, was found to contain 0.263 grains free ammonia, and 0.065 grains albuminoid ammonia per gallon, representing a very large amount of organic impurity. He then says: "The organic particles are rendered so heavy by soaking with water that they are not raised with the aqueous vapor, or by wind blowing over the surface. Marshes and swamps, in a dry season, when the water is low and the particles are drying on the muddy sides and on the vegetation on the banks, are frequently highly pestilential. Mr. Baldwin Latham in his work on *sanitary engineering* on this point says: 'One thing is certain, with reference to malaria, that all authorities are agreed that it is never extricated from a water surface.' These methods of answering the question are, however, not quite conclusive, although they doubtless show a high probability in favor of the opinion expressed. I therefore set myself, by direct experiment, to determine the point." The author's method consisted in drawing contaminated air through water and then studying the effects of this air upon various liquids capable of nourishing germs. His conclusion is that germs do not pass through the water. With reference to water-traps he says: "They exclude the soil-pipe atmosphere to such an extent that what escapes through the water is so little in amount, and so purified by filtration, as to be perfectly harmless."

Dr. Carmichael regards my experiments with air contaminated with decayed meat, described briefly in the preliminary report published in the "National Board of Health Bulletin" for January 31, 1880, as confirming the conclusion that water retains the organic matter from air passed through it. This, however, is only true, if we assume that albuminoid ammonia is a measure of the organic impurities. There still remains the suggestive odor of the air, after it has passed through the water, to be explained. Is this air, in spite of its odor, harmless? Special experiments would be required to answer this question.

Within a very short time Wernicke (*Virchow's Archiv*, 79, 424) has published an elaborate paper on the air as a transporter of germs, and in this he shows that bacteria are not taken up from a putrefying liquid or moist slime, but when there are bubbles in the liquid which break and throw up a spray the air becomes contaminated.

2. Air was next contaminated by means of meat which was allowed to pass to the last stages of decomposition and gradually become dry. The experiments with this air were carried far enough to show that it yields a considerably larger amount of ammonia and albuminoid ammonia than ordinary air, and the conclusion may be drawn that "malaria" if, as is supposed, it arises from dried matter, will probably be found to yield an abnormally large quantity of albuminoid ammonia. Experiments upon this point are, however, entirely wanting up to the present.

3. Finally, air contaminated by the process of respiration was examined. For this purpose an air-tight box, about three feet long by two feet high and two broad, was prepared, and into this was placed a good-sized dog. Air was then drawn slowly through this box and examined as usual. Two determinations are here given. These were made at the same time.

1st experiment—Free ammonia	0.287 gram.
Albuminoid ammonia	0.339 gram.
2d experiment—Free ammonia	0.220 gram.
Albuminoid ammonia	0.309 gram.

The amount of ammonia and of albumoid ammonia found are somewhat larger than the amount found in the external air at about the same time, though not as great as were found in some experiments with external air at other times.

Two dogs were then placed in the box and the air examined in the same way. No perceptible change was noticed in the composition of this air compared with that contaminated by the presence of one dog in the chamber.

In this connection, it should be remarked that Smith made use of the permanganate test to examine air contaminated by the breathing process, and noticed an increase of oxidizable material in such air. But he did not observe a difference when two persons were placed in the lead chamber (which corresponded to the dog-box used in the experiments described above) and when there were three. In regard to this point he says: "The cause may be that only a limited quantity is kept in suspension in the air, the rest being deposited."

Apparently the most remarkable results yet reached in the analysis of air are those recently described by W. Van Slooten (*Journal American Chemical Society*, 1, 263), who undertook to determine the *free* and *albuminoid ammonia* in the air of New Orleans during a part of the year 1878, covering the period of the yellow-fever epidemic. He found: "First, that the air was abnormally charged with albuminoid ammonia during the epidemic; second, that the abnormality disappeared with the fever; third, that the atmosphere not in immediate connection with the ground was comparatively free from any abnormal variations from an average standard." It would be venturesome to accept these results without verification. The figures given by Van Slooten are certainly in accordance with the view that, at the time of the epidemic, the air is abnormally charged with albuminoid ammonia. This may be true, and, nevertheless, it may be that no direct connection exists between the epidemic and the albuminoid ammonia. Conclusions like that of Van Slooten can only be of value when it has been shown that during an epidemic there is more albuminoid ammonia in the air than there is at the same period of other years when epidemics are not raging. It should, further, be said that the description of Van Slooten's experiment is not calculated to inspire confidence in the results, and, until further evidence of the accuracy of the work is furnished, not much weight can be attached to his statements.

Ammonia and albuminoid ammonia as measures of the impurity of the air.—From what was said above, it will be seen that the question whether the amounts of ammonia and albuminoid ammonia yielded by air can be regarded as reliable measures of the impurity of the air is still an open one. Up to the present the nitrogenous materials have been regarded as the really injurious ones, and an increase in the quantity of the two forms of ammonia has been sufficient to condemn the air yielding it. In Dr. Smith's works it is constantly assumed that the substances yielding ammonia are the injurious ones, and so, too, it is common to regard the analogous substances found in water as the objectionable ones. In a recent work by C. B. Fox the same idea is upheld. He says: "Ammonia, which in itself is harmless, is a product of animal organic matter, and is present in air in exceedingly variable quantity, out of which it is washed by the great air cleanser, rain." Again he distinctly says that the ammonia in the air is "derived from decomposing animal matter, such as manure, sewage, effete matter from the lungs and skin of men and other animals."

In a discussion of the results reached in the air analyses of Glasgow and Montsouris, above referred to, Dr. James B. Russell calls special attention to the fact that the analyses show in general *that there is an increase of ammonia and albuminoid ammonia in the winter months.* The Parisian and Glasgow results both agree in this respect. Accepting this as a general truth, it is plain that the source of the nitrogenous matter cannot be mainly decaying organic matter. If the latter were the source, the largest amounts of the two ammonias should be found in the summer months. Dr. Russell unhesitatingly accepts the view that a comparatively prolific source of the nitrogenous matter is the combustion of coal, which would of course account for the increase noticed in the winter months. This gives rise to new difficulties; for the question is in each result, how much of this nitrogen is derived from decomposition and how much from combustion?

The simple statement of fact that a given sample of air yields an abnormally large quantity of albuminoid ammonia is not sufficient to enable us to draw a conclusion with reference to the purity of the air. We must know at what season of the year the air was collected, and whether in the city or country; in fact, we should know everything possible concerning the air, and then let the conclusion finally drawn be a resultant of all the facts. It is probable, however, from what is now known, that the determination of the amount of albuminoid ammonia yielded by air may under many circumstances furnish us with important information concerning the quality of the air, but great caution is necessary in dealing with this principle of examination.

General conclusions.

In looking back over the field traversed I cannot avoid a feeling of dissatisfaction. A great deal of time has been spent in this investigation. Constant attention to minute details has been necessary, and at times disappointment has followed disappointment. Here and there, however, light has been thrown upon the subject; and whatever its future development may be, I think the facts established here will always stand. Let us, then, pass quickly in review the main results.

1. The nitrogenous matter of the air may be thoroughly collected by means of the pumice-stone absorber described in this report.

2. The total amounts of ammonia found in experiments performed at the same time with the same specimens of air agree fairly well with one another; so much so as to warrant the use of the method for the examination of the air.

3. When free and albuminoid ammonia are determined, the results obtained do not always agree very closely, but still the agreement is sufficient to enable the experimenter to detect such variations as are likely to occur between pure and impure air.

4. Air contaminated by being drawn through water containing decaying meat does not yield more than the usual quantity of albuminoid ammonia.

5. Air contaminated by being drawn over comparatively dry decaying organic matter yields more than the usual quantity of albuminoid ammonia.

6. Air contaminated by respiration yields more than the usual quantity of albuminoid ammonia.

7. It is necessary in judging of the purity of air to take all the facts known in regard to it into consideration. The simple determination of any one constituent can never be a sufficient basis for the formation of a competent judgment.

8. It would be useless to have examinations of air made by any but the most careful workers. It would be time thrown away to have such analyses made by the average practical chemist.

Finally, as to suggestions for the future. A number of questions have been left unanswered in this investigation. A very important one is this: Is the air which has been deprived of its nitrogenous matter also deprived of its injurious constituents? If this is ever to be answered, it is evident that it cannot be by chemical methods. The effect of the air on fermentable liquids must be studied, and also on animals. Can an animal continue to breathe normally in such air?

A second question which ought to be answered is this: Does the amount of organic matter in the air vary with different conditions of the air, as, for instance, with the hygrometric state? This can only be answered by a long-continued, systematic series of examinations of the air, such as are at present being made at Glasgow, Montsouris, and at some places in Germany. It may be said, however, that, up to the present, no connection has been observed between the amount of organic matter and other conditions of the air.

Again, it would be interesting to determine how much nitrogenous organic matter from ordinary contaminating sources can be held in suspension in the air.

Many other questions suggest themselves, but those given above indicate that an almost unlimited field opens before us, and show clearly that the only way in which results of great value can be reached is by united effort. A single individual can do little more than point out the way in which results may be reached, and clear the road for advances. It will only be when health departments in a great many places are impressed with the importance of such subtle examinations as those of the air, and provide the means for making them through long periods, that our knowledge will be materially increased on the subject treated in this report. When records, made year after year by competent men using the best methods, are in our possession, then probably conclusions of great importance for sanitary science will be drawn.

IRA REMSEN.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

REPORT ON THE ADULTERATION OF DRUGS.

Inquiries having been made by the National Board of Health as to the propriety of legislation to prevent the adulteration of medicinal drugs, the committee of the Philadelphia Drug Exchange, to whom the matter was referred, present the following report as the result of their careful consideration of the subject:

REPORT.

Having given the question of the adulteration of medicinal drugs attention on this as well as on previous occasions, we desire to report that to the best of our knowledge and belief such adulteration is of limited extent, but were the evil so great a one as seems to be apprehended, it would be almost impossible to correct it by legislation.

The articles are so numerous and pass through so many hands before reaching the consumer, that any law would either be oppressive in being enforced, or inoperative through failure to extend its action to the extreme reach of its requirements. It would be impracticable to so regulate the power of the officers charged with its execution that well-recognized private rights of manufacturers and dealers could be held safe from infringement.

Processes, the result of large expenditure or of long experience, might be subject to examination and publicity; operations with articles in a formative state might be stopped; stocks in the hand of manufacturers or dealers might be liable to investigation at any time—possibly many times—and might, perhaps, be jeopardized by the application of a standard not justified by the use of the article.

In this respect the officer would not be limited, for of necessity much discretionary power would be delegated to him, and this might be wisely or unwisely used. An incompetent or captious officer might cause incalculable difficulty and pecuniary loss by an erroneous judgment, an unaccommodating disposition, or a spirit to exact the letter of the law according to his own interpretation.

Losses in mercantile transactions might be entailed, for referred cases on appeal would doubtless be numerous, and markets would be changing in prices while awaiting authoritative decision.

Should objectionable preparations be found, the responsibility for them would be difficult to fix, as the holder might be innocent, equally so the manufacturer, and the fault lie somewhere between. To make examinations complete they would have to follow the article through its whole course in trade. It is easy to see what great embarrassment to business must ensue and what the uncertainty of result.

As before stated, we are satisfied that the extent of adulteration of medicinal drugs has been overestimated. Perhaps this is due to the publicity given to the few reported cases of the kind; but this publicity itself forms a corrective to their increase.

The retail druggists and physicians who purchase from the wholesale dealers and manufacturers should be fully capable of discrimination, and disposed to buy only of those who deal in the purest articles and who are known to the trade as houses of integrity. This, after all, would be the greatest safeguard to consumers of medicinal drugs. Since the establishment of colleges of pharmacy special attention has been given to purity of medicinal preparations and with marked success, as is shown by the known sympathies and practices of their graduates as a class; and the journals published by these institutions exercise a wholesome effect by denouncing unworthy preparations.

EDWARD H. HANCE,
Chairman.
WILLIAM GULAGER.
H. N. RITTENHOUSE.
ALEXANDER H. JONES.
C. A. KURLBAUM.
VALENTINE H. SMITH.

The above report was adopted by the board of directors of Philadelphia Drug Exchange at a special meeting held December 30, 1879.

H. C. McILVAINE, *Secretary.*

INSPECTORS' REPORTS.

MEMPHIS, TENN., August 31.—Dr. R. W. Mitchell, member of the National Board of Health, forwards a report of Dr. C. A. Rice, inspector at the quarantine station near Vicksburg, dated August 29. The tow-boat *Raven*, with barges, arrived August 28, with five sick on board. The boat was detained for observation, but there were no means of preventing desertion of the crew; about half of them left, intending to go to Vicksburg. The five sick men were removed to a float, and on examination of their history and symptoms, Dr. Rice concluded that they were affected with *dengue* fever, which Dr. Collins reports to be prevalent in New Orleans. From the detailed account of the several cases, as given by Dr. Rice, the above opinion was regarded by Dr. Mitchell as probably correct.

NOTICE TO PILOTS.

The following notice has been issued by the mayor of Fernandina, Fla.:

MAYOR'S OFFICE,
Fernandina, August 20, 1880.

Pilots will in all cases, before boarding, make inquiry as to the sanitary condition of the vessels destined for this port.

Vessels with cases of sickness on board, or on which serious cases have occurred during the voyage, will be ordered to proceed at once to the national quarantine station at Sapelo. All other vessels will be governed by the quarantine laws now in force.

By order of city council of Fernandina.

JAMES McGIFFIN,
Acting Mayor.

W. F. WOOD, Jr., *City Clerk.*

ABSTRACTS FROM CONSULAR REPORTS.

BAHIA, BRAZIL.—A letter from United States Consul R. A. Edes is forwarded by S. C. Cobb, president of the board of health of Pensacola, Fla. The consul states that the British bark Bonnie Dundee, bound for Pensacola, obtained a clean bill of health from Bahia, July 18, on a statement that the vessel had been free from disease while in that port. It was afterward ascertained that yellow fever had occurred on board the vessel, and one man was sent to hospital with that disease after the bill of health had been granted. This notice being received at Pensacola before the arrival of the bark, proper precautions will be taken.

CALCUTTA.—Reports for May, 1880, record 580 births and 706 deaths during the month. Annual birth-rate 15 per 1,000, death-rate 19.7. Cholera caused 47 deaths, small-pox only 4, "fevers" 204, diarrhœal diseases 75.

GUAYMAS, MEXICO.—United States Consul A. Willard reports, for the month of July, 18 deaths in a population of 5,500. Of these, two were from violence, leaving an annual death-rate from diseases of 35 per 1,000. Only four of the decedents were adults; the rest were under 5 years of age, and several deaths were due to whooping cough. Mean temperature 88.4; sanitary condition good.

SABANILLA, UNITED STATES OF COLOMBIA.—United States Consul E. P. Pellet writes, under date of August 18, that on the 10th a fatal case of yellow fever occurred in a young American just arrived from the interior. He had been for two years at Puerto Berrio, a most unhealthy place. Imprudence in diet is supposed to have aided in developing the disease.

SANTIAGO DE CUBA, August 25.—United States Consul J. C. Landrean reports that correct statistics are difficult to obtain. The report for the month of July gives 154 cases of yellow fever, but these figures cannot be relied on as accurate. The disease is, however, epidemic in the city, and bills of health are issued accordingly.

SINGAPORE.—United States Consul A. G. Studer reports that up to July 17 no epidemic or contagious disease has prevailed in this port or in the adjacent country.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—Dr. E. Nelony, health officer, under date of August 16, reports two cases of confluent small-pox, being the first cases reported this season. In the first, a child of 5 years, the origin of contagion could not be traced. The second, a woman of 35, contracted the disease from a case in Matamoros. Neither of the patients had ever been vaccinated. Due precautions are taken to prevent the spread of the disease.

HAVANA, CUBA.—During the week ending August 27 there were 28 deaths from yellow fever, mostly occurring among civilians and sailors. But few vessels have discharged at the wharves during the month of July without having some cases of yellow fever on board, though some have been so mild in type as to give some excuse for the captains denying that the disease had appeared on their vessels at all.

The following vessels, which had sailed or were about to sail for ports in the United States, are believed to have had yellow fever on board while at Havana: American bark *Payson Tucker*, for Delaware Breakwater, August 21; Spanish bark *Antonio Batet*, for Brunswick, Ga., August 23; American schooner *Emma F. Lewis*, for Washington, D. C., August 25; American brig *Martha A. Berry*, for Boston, August 25; Spanish bark *Maria Coruña*, for Cat Island, Miss., August 27; American brig *Ortolan*, for Philadelphia, to sail August 29.

DIAGRAM TO SHOW THE PROPORTION OF DEATHS PER 1,000 PER ANNUM AS RECORDED IN THE MORTALITY REPORTS FURNISHED THE NATIONAL BOARD OF HEATH FOR THE FOUR WEEKS ENDING AUGUST 7, 14, 21, AND 28, FROM THE FOLLOWING PLACES.

[The black lines represent mortality over 5 years; the white lines represent mortality under 5 years; both represent total mortality per 1,000 per annum.]

The following reports for the week ending August 28 are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 4; under 5 years, 1; diphtheria 1. Allegheny, Pa., 78,000; deaths, 17; under 5 years, 11; consumption 1, diarrhœa 4, diphtheria 2, pneumonia 1, whooping cough 1. Battle Creek, Mich., 7,500; one death, under 5 years, cholera infantum. Belfast, Me., 5,308; deaths, 3; consumption 1, diarrhœa 2. Boulder, Colo., 3,030; deaths, 3; under 5 years, 1; diarrhœa 1, enteric fever 1. Brattleborough, Vt., 6,000; consumption 1. Calais, Me., 6,162; diphtheria 1. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 6,400; one death. Clinton, Mich., 1,205; no deaths. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 955; no deaths for two weeks. Cumberland, Md., 10,667; diarrhœa 1, under 5 years. Dallas, Tex., 10,300; deaths, 6; under 5 years, 2; diarrhœa 1, enteric fever 2. Davenport, Iowa, 23,000; deaths, 4; under 5 years, 1; scarlet fever 2, pneumonia 1, puerperal 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Franklin, Ind., 2,700; deaths, 2; puerperal 1. Helena, Mont., 3,650; one death. Hernando, Miss., 1,000; no deaths. Huntingdon, Tenn., 1,200; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; no deaths. Kenosha, Wis., 5,500; deaths, 3; under 5 years, 2; diarrhœa 2, old age 1. Lebanon, Pa., 9,000; deaths, 5; under 5 years, 1; croup 1, enteric fever 2, puerperal 1. Madison, Ind., 9,009; deaths, 5; under 5 years, 2; scarlet fever 3. Meridian, Miss., 4,013; one death, old age. Milledgeville, Ga., 3,000; deaths, 2; malarial fever 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; deaths, 2. Muscatine, Iowa, 8,412; scarlet fever 1. Muskegon, Mich., 11,300; deaths, 7; under 5 years, 3; consumption 2, croup 1, diarrhœa 1, malarial fever 1. Natchez, Miss., 7,000; deaths, 3; under 5 years. Niles, Mich., 4,200; consumption 1. Ocala, Fla., 1,000; no deaths. Okolona, Miss., 2,000; no deaths. Oshkosh, Wis., 17,030; deaths, 8; under 5 years, 6; diarrhœa 5, pneumonia 1, old age 1. Painesville, Ohio, 5,500; no deaths. Pass Christian, Miss., 4,000; one death. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; deaths, 2; under 5 years, 1; enteric fever 1, malarial fever 1. Port Royal, S. C., 750; no deaths. Portsmouth, Ohio, 11,320; deaths, 4; diarrhœa 1, old age 1. Rensselaer, Ind., 900; no deaths. Ripley, Miss., 1,000; no deaths. Rock Island, Ill., 12,000; deaths, 3; under 5 years, 2; diarrhœa 1, enteric fever 1. Rockland, Me., 7,500; deaths, 3; under 5 years 2; diarrhœa 2. Santa Cruz, Cal., 5,000; old age 1. Springfield, Ohio, 21,000; deaths, 8; under 5 years, 2; consumption 2, puerperal 1. Starkville, Miss., 1,454; one death, under 5 years. Steubenville, Ohio, 13,500; deaths, 4; under 5 years, 1. Summit, Miss., 1,807; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; old age 1. Verona, Miss., 1,000; diarrhœa 1, under 5 years. Wesson, Miss., 2,000; no deaths in three weeks. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; consumption 2. Youngstown, Ohio, 15,089; deaths, 5; under 5 years, 4; diarrhœa 2, pneumonia 1, whooping cough 1. Total population, 406,465; deaths under 5 years, 49; total number of deaths, 119; annual rate per 1,000, 15.2.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to hav the white and colored populations given separately.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, SEPTEMBER 18, 1880. [No. 12.

AN ABSTRACT OF ALL THE QUARANTINE LAWS, ETC., OF THE STATE OF SOUTH CAROLINA.

[By R. LEBBY, M. D., health officer of the port of Charleston.]

By act of October 8, 1698.

All vessels are forbidden to pass to the *west of Sulivan's Island one mile* without permission of the governor, under penalty of being fired on by the gunner, and paying a fine. The pilot is required to ascertain from the captain, before passing that limit, if any contagious disorders are on board, under penalty of £50. This act was of force two years.

June 7, 1712.

Gilbert Guttery was appointed health officer for the province to inquire "into the state of health of all persons as shall arrive on board ship." He was to go on board all vessels as soon as they crossed the bar, and make these inquiries; also, concerning the deaths on the passage; search the ship, and order all the men on deck for that purpose. He was empowered to administer oaths to captain and crew touching this law, and, upon cause, to send persons to the pest-house on Sulivan's Island, to have the vessel fumigated, and to detain her for twenty days without communication, except with Sulivan's Island. The diseases then specified were "the plague, small-pox, spotted fever, Siam distemper, Guinea fever," &c. The penalty was £100. The pilot must wash himself and his clothes, before coming ashore, after being on board of any vessel arriving from south of 30° N. L., under penalty of £20. No person shall visit such ship before the commissioner posted his public certificate, under penalty of £100, or being whipped through the public streets. Nor shall the captain send a boat ashore before said certificate, under penalty of £50, together with a forfeiture of all negroes and other goods he may put ashore. No person should leave the pest-house without permission, under penalty of £30. The commissioner shall allow no one but himself to go aboard, and he must cleanse himself before his return ashore. The commissioner has full charge of the pest-house, furnishing nurse, repairs, conveniences, to the value of £15 *per annum*. Persons in the pest-house must maintain themselves, the commissioner causing the provisions to be carried there at market prices. The commissioner's salary to be £40. This act was of force for two years, and was confined to the port of Charleston—other ports being left to the discretion of the governor.

September 1, 1721.

The same provisions as the act of 1712, except the pilot "shall (wind and tide permitting) bring the said ship above Johnson's Fort, so that she may be under the command of the guns of the said fort." That the captain, or the doctor, or officer and sailor shall apply to the commandant of said fort, and answer whether "the place from whence he came is healthy"; whether "his ship's company is in health"; or "died on the voyage"; "from what distempers"; and "how long since." The commandant may permit him to pass, but he must then apply to the governor, who being satisfied, the ship shall be "permitted to enter and trade." If the commandant or governor is not satisfied, the ship shall be removed to a place, by them designated, for quarantine. The consignee may furnish provisions to his vessel under the direction of the governor; but no one shall go on board without his permission, or his boat shall be confiscated. In case of a hurricane, the quarantined ship may seek safety up the river. The provisions of this act extend to any other port in the province.

Act of September 18, 1738.

The Spanish in Havannah and St. Augustine being about to invade the province, and there being fear of the spreading of small-pox, no person having small-pox shall come within two miles of Charleston, or be inoculated within that limit, under penalty of £500. The justices of the peace shall remove infected persons outside of the limits and guard their houses. Persons refusing to assist the justice to be fined £20. All infected houses in the country shall be advertised on the public road and at the church; and a white rag tied to the gate of the house or plantation, under penalty of £50. The justices are charged with cleansing infected places. The act of force one year.

May 29, 1744.

One thousand pounds appropriated for Sulivan's Island pest-house. No ship with negroes from Africa shall pass to town without the negroes staying 10 days at the pest-house, or carried on shore 5 out of 10 days for purification, upon pain of confiscation. No one from shore shall go on board said ship; and no one leave said ship under penalty of whipping. The captain upon passing Fort Johnson shall swear conformity. The act was of force for three years.

January 13, 1747.

The form of pilot's oath, when receiving his branch, that he will make inquiries for contagious diseases, is enacted. Pilot shall receive ten shillings *per diem*, while at quarantine, unless captain informed him before he went aboard. No one to leave the vessel without a pass. No vessel coming from any part of America where the commander of Fort Johnson has heard there is "plague, malignant fever, small-pox, or any other contagious distemper," shall be permitted to pass Fort Johnson, if the officer of the vessel refuses to swear, unless with the consent of one of the doctors signing, date, Moultrie, Martine, Caw, and Rind. Their fee for visiting vessel, £7 10*s*., and boat hire. The commandant at Fort Johnson shall signal for the doctor.

April 13, 1756.

The act of June 13, 1747, renewed for one year.

April 7, 1759.

The pilot's oath of 1747 re-enacted; and the foregoing provisions for quarantine renewed. In any other port than Charleston under the guns of any fort is substituted for "Fort Johnson." No vessel with more than thirty whites or ten blacks shall approach the city without staying 10 days at pest-house or on the beach of Sulivan's Island, except by leave of the doctors, who must not give permission before the ninth day. Persons going on board a vessel at quarantine must stay until her time is out, and forfeit their boat and £50, or suffer corporal punishment. Pilot to be paid 20 shillings per diem for detention at quarantine, unless he was informed of the sickness, or omitted to comply with his oath as to questions. This act applies to all ports of entry. The public treasurer must sue in a *qui tam* action for all penalties; in which the general issue may be pleaded. This act of force for five years.

May 30, 1760.

Act of 1738 re-enacted, in effect. The commissioners to be at the State-house, Charleston, from 9 to 12 m., to receive a list of the infected, which all the inhabitants are charged to bring to them, and publish their names, and where they are, in the Gazette.

March 26, 1784.

Act of 7th April, 1759, repealed. No pilot shall bring in a vessel before examination under penalty of £100. That the commanding officers of forts in the various harbors cause the captains to answer on oath the questions in act of 1712. If not satisfactory, the vessel is stopped until the pleasure of the governor is known, and the vessel is made to perform such quarantine as may be deemed proper. No person to go on board or on shore without permission. The pilot's fee is a guinea per diem. Vessels from the Mediterranean must perform quarantine, unless they have a proper bill of health, setting forth number of persons on board, and their condition of health at the time of leaving port. The crew may be ordered to leave the State or do quarantine for 40 days in the discretion of the governor. Pest-houses and warehouses to be erected on Sulivan's Island; and a small fort to be erected in each other harbor, for the purposes of this act. The commandant at Fort Johnson shall hold this appointment. Woolen or cotton cargoes shall be taken to the warehouses to be aired. Penalty of captain or doctor, £1,000 for violations.

March 17, 1785.

The 40 days' quarantine for Mediterranean vessels repealed and made discretionary with the governor.

December 19, 1796.

The power of governor concerning quarantine vested in the city council of Charleston (when the governor is absent from the city), and in the commissioners of streets of Beaufort and Georgetown. The city council to sell the lazaretto on Sullivan's Island or rent out the same, raise a tax on the lot holders of $13, and remove the house to some other place (on the island).

December 16, 1797.

The governor may hire boats and men to enforce the quarantine regulations, and arm them if necessary.

December 19, 1809.

The quarantine officers may board, by force of arms, any vessel, and detain crew and passengers, who may violate quarantine—the penalty of the latter is from $100 to $2,000 fine. A pilot shall lose his branch for violating quarantine law as well as be fined. Any vessel violating quarantine laws may be fired into.

December 20, 1832.

Authorizes the city council of Charleston, and the intendant and wardens of Beaufort and Georgetown, to regulate quarantine. Their orders to be published in two newspapers of Charleston. They shall have infected vessels cleansed at the expense of owners. These regulations to extend 20 miles from Charleston, Georgetown, or Beaufort for wrecked vessels. Infected vessels shall depart the State upon notice; besides, fines and imprisonment of 12 months for violations is imposed. Vessels violating quarantine may be fired on. Pilot bringing vessels beyond the limits to be fined £100 and lose his branch.

December 21, 1839.

No more cellars in Charleston or in villages within 20 miles from coast to be dug under penalty of $500 to $1,000.

December 19, 1849.

Interments in Charleston to be permited with a certificate of the disease.

January 28, 1861.

No one permitted to enter or pass the quarantine line except by permission of governor or mayor, under penalty of 1 year imprisonment, and not exceeding $2,000 fine.

September 26, 1868.

Quarantine grounds at Charleston, Georgetown, and Hilton Head to be designated by buoys. Vessels coming from infected ports to be quarantined at least (4th sec. 1st clause) 30 days after arrival and 20 days after discharge of cargo, when she arrives between 1st May and 1st November, or, 2d, any place in Asia, Africa, or the Mediterranean or the West Indies, Bahama, Bermuda, or Western Islands, or American port south of Hilton Head. They shall be visited by the health officers, and detained only so long as is necessary to ascertain condition of health. Steam vessels shall be at the discretion of the health officer. Vessels at quarantine on 1st November are subject to regulations of those arriving after that day. Vessels may, after going to the wharves, be quarantined, ordered off, &c. The master must deliver to the mayor or intendant within 24 hours the permit of the health officer, after his vessel has been quarantined. She may go to sea without breaking bulk. Pilots must make inquiries concerning health, and anchor vessels accordingly within quarantine buoys; prevent communication by boat or person; furnish a copy of this act to the captain; report all violations of the act; and subject themselves to such delay and cleansing as the health officer may direct. The health officer must board vessels subject to quarantine between sunrise and sunset, and inquire of the health, condition of vessel, and cargo; inspect bill of health, &c.; examine on oath witnesses; and report facts and conclusions, especially number of sick, nature of disease, &c., to the mayor. He must reside within or near quarantine ground; he has power to remove any dangerous vessel south and east of quarantine ground; to purify vessel; discharge or land cargo (or destroy it with the concurrence of the mayor); to prevent persons leaving until 15 days after the last case of disease and 10 days after arrival; to vaccinate all persons at quarantine; to administer an oath; he may order the sheriff, &c., to arrest and confine at quarantine for 10 days. A quarantined vessel to be designated by colors in the main shrouds. No boat or lighter to pass through quarantine ground without permission. The master shall provide for all on board, or health officer shall do so, at expense of vessel; and vessel shall not leave until the debt is secured The health officer may confine a prisoner on shore during the quarantine. An appeal lies to the governor, attorney-general, comptroller-general, as a board of appeal from health officer, in writing, within 12 hours from order. In 12 hours after notice health officer must make his return in writing to the governor, who shall call the board, for a hearing, in 24 hours; and until discussion the order is suspended, except for detentions, &c. The health officer may employ parties to do his orders on vessels, and their compensation shall be a lien on the vessel. Fine, $100 to $500; imprisonment, 3 to 6 months.

The governor may issue his proclamation declaratory of any infected port; shall limit the time, and may extend the time. Vessels coming from such ports subject to quarantine. Masters violating quarantine subject to penalty not exceeding $2,000 and 12 months imprisonment, or both.

There shall be one health officer at Charleston, one at Georgetown, and one at Hilton Head, who shall hold office for the term of two years, with salary of $1,200 (Charleston, $1,500) and $15 per month for boat hire. They shall keep a faithful record and report the same to the governor monthly. The governor shall pay for quarantine guard out of State funds. All violations shall be tried in the court of sessions.

March 9, 1869.

The health officers must be graduates of medical schools. Vessels arriving after November 1 with small-pox, cholera, typhus or infectious or contagious diseases, or from any foreign ports having passengers, shall be anchored at quarantine ground and be visited by health officer and subject to his regulations.

March 19, 1869.

Governor and health officer to have a lazaretto constructed on Morris Island. The health officer shall be stationed at Fort Johnson or on Sullivan's Island, and buildings shall be erected for his accommodation. $8,000 appropriated.

February 7, 1875.

The act of 1868 amended by striking out "thirty" and inserting "fifteen days" in 4th section 1st clause, and "at least 20 days after their cargo has been discharged"; and 2d clause "any place south of Hilton Head."

December 23, 1878.

A State board of health created, consisting of S. S. Marshall, president; F. L. Parker, J. B. Dubose, J. J. Horton, vice-presidents; H. D. Fraser, corresponding secretary; A. S. Hydrick, recording secretary, and T. Grange Simmons, treasurer, with the Attorney-General and Comptroller-General and their associates and successors. They are to be the sole advisers of the State concerning health, and make annual reports to the legislature. Every seven years an executive committee is to be appointed by the governor, upon the recommendation of the association, who may be removable by him, and he may fill vacancies. They shall elect a chairman and a secretary; the latter shall be "registrar general" They may divide the State into health districts and appoint subboards of health of two physicians and one layman. They shall investigate causes of disease, influence of climate, occupation, drainage, &c., and inspect annually, at least, all public institutions. The State board shall supervise quarantine and establish the same with the advice and consent of the governor. They shall recommend laws for registration of statistics. $2,000 appropriated for this purpose.

December 23, 1879.

Quarantine anchorage at Port Royal, one mile below or south of Johnson's or Saint Helena River. A site shall be purchased and buildings erected, by three commissioners appointed by governor, for $5,000, and the act of 1875 amended so as to include vessels on a passage south of Capes Hatteras, Henlopen, or Fear.

N. B. The following acts of the general assembly were formally repealed in the act of 1870, generally known as the General Statutes, to wit: 1712, 1721, 1744, 1759, 1784, 1785, 1796, 1797, 1760, 1832, 1839.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

MONTHLY REPORT OF MORTALITY IN CITIES OF THE UNITED STATES.

Cities and States.	Month.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Consumption.	Croup.	Diarrhœal diseases.	FEVER. Diphtheria.	FEVER. Enteric.	FEVER. Malarial.	FEVER. Scarlet.	FEVER. Yellow.	Lung diseases, acute.	Measles.	Puerperal diseases.	Small-pox.	Whooping-cough.	All zymotic diseases.	Accidents.

NOTES.

PROVIDENCE, R. I.—In addition to the mortality given above, there were, in July, 9 still-births, 4 of American and 5 of foreign parentage. The deaths from diarrhœal diseases were more than for July, 1879, but not so many as in some former years. In 1876, they formed 41 per cent., and in 1880 only 36.4 per cent. of the total mortality. The total death-rate of white and colored differed only by a fraction. The deaths under 5 years were more than 55 per cent. of the whole number. In August, there were 5 still-births, 3 being of American parentage. The deaths from diarrhœal diseases in this month were less than 18 per cent. of the total. The death-rate of the colored population was 33, while that of the white was less than 19 per 1,000 per annum. The deaths under 45 years were less than 45 per cent. of the whole number.

NEW HAVEN, CONN.—Mean temperature for July, 73°.5; mean daily range, 15°.7; rain fell on 14 days; mean humidity, 73.5; prevailing winds, south. For August, mean temperature, 70°.1; mean daily range, 17°.2; rain on 10 days; mean humidity, 76.8; prevailing winds, south.

BURLINGTON, VT.—Marriages in June, 5; births, 32; mean temperature, 68°.1; mean humidity, 62.3; rainfall, 1.33 inches.

SCRANTON, PA.—For July, 8 marriages and 88 births; annual birth-rate, 26.4 per 1,000.

DISTRICT OF COLUMBIA.—The population of the District is now estimated at 180,000; but, in the absence of the official return, the health officer retains the former estimate of 170,000. The death-rate is probably about 30.5, instead of 32.4 as in the table. That of the white population is stated at 23.2; of the colored at 45.5. The mortality under 5 years was 58.8 per cent. of the total. Births in June, 272, giving an annual rate of 19.2 per 1,000; of these, 139 were white and 133 colored, giving an annual rate per 1,000 of 14.6 for the white and 28.5 for the colored population; still-births, 25, of which 11 were white and 14 colored. Marriages *reported*, 72: white, 47; colored, 25. Highest temperature noted, 96°.5; lowest, 49°.5; mean daily range, 19°.9; prevailing winds, west; highest velocity 26 miles, south; rain on 14 days; rainfall, 3.52 inches.

NORFOLK, VA.—Of the 73 deaths in July, 31 were white, giving an annual death-rate of 24.9; among the colored population there were 42 deaths, and the rate was 44.6. Of those under 5 years there were 14 white and 23 colored. Only 1 still-birth is reported.

PETERSBURG, VA.—There were 23 deaths in August among the white and 29 among the colored population, making their respective death-rates 26.4 and 29.0 per 1,000 per annum. Of the deaths under 5 years, 6 were white and 14 colored. Population, 10,000 white, 12,000 colored.

MOBILE, ALA.—The total of deaths during the six months was 326. Of these, 153 were white, rate 10.9; and 173 were colored, rate 28.8 per 1,000 per annum. The still-births were 34; of which 11 were white.

SELMA, ALA.—Of the 16 deaths in July, 9 were white and 7 colored, making the respective death-rates 31.5 for the white and 21.2 for the colored population.

BATON ROUGE, LA.—Of the 20 deaths in July, there were 7 white and 13 colored. Relative populations not given. In August the deaths were 6 white and 6 colored. In each month there was one still-birth, both colored.

AUSTIN, TEX.—Of the 26 deaths in June there were 17 white and 9 colored, the respective death-rates being 17 and 27 per 1,000 per annum. The rate for the year 1879 was 15.5. Rain-fall in 1879 was 18.34 inches; highest temperature 100, lowest 16.

NASHVILLE, TENN.—The deaths for July were 66 white, 60 colored; death-rates 28.4 white, 45.9 colored. Daily mean temperature, 86°.5 highest, 71 .7 lowest; mean for the month 78°.4. Rainfall, 5.69 inches. Prevailing winds northwest. For August the deaths were 52 white and 46 colored; death-rates, 22.4 white, 35.4 colored. Daily mean temperature, highest, 87°.2; lowest, 68°.2; mean for the month, 79°.4. Rainfall, 2.22 inches. Prevailing winds, east.

TOLEDO, Ohio.—In the table the still-births and premature births are deducted from the number of deaths given in the report. In June there were 7 of these, and in July the same number. The death-rates in the table are taken from the report, without correction for still-births.

CHICAGO, ILL.—For July, 80 premature and still-births, which should be deducted to obtain the proper death-rate. Mean temperature 72°.7; highest, 95°; lowest, 57°; prevailing winds, southwest; rain on 15 days; and rainfall 3.5 inches. For August 57 premature and still-births are noted. Mean temperature, 72 .9; highest, 93°; lowest, 53°; prevailing winds, northeast; rain on 15 days; rainfall, 4.47 inches.

MILWAUKEE, WIS.—For July, 11 still-births and 2 premature births are noted; these are not included in the mortality. Highest temperature observed, 94°; lowest, 50°; greatest daily range, 26°; least, 8°; mean daily average, 15°.5; mean for the month, 68°.9; rainfall 3.2 inches; prevailing winds, north; rain fell on 21 days.

SAINT PAUL, MINN.—Mean temperature for the month, 76°.6; highest, 93°; lowest, 52°; prevailing winds, northwest; rain on 16 days; rainfall, 2.75 inches.

KEOKUK, IOWA.—Of the 18 deaths in July, 12 were white, annual rate, 12.9; and 6 colored, annual rate, 75 per 1,000. Mean temperature, 62°.3; highest daily mean, 91°.3; lowest, 44°; rainfall, 2.25 inches. For August the races are not separated in the report. Highest temperature noted, 100°; lowest, 56°; prevailing winds southwest; rain on 9 days; rainfall, 3.81 inches; mean temperature for the month, 78°.5.

OAKLAND, CAL.—In July, 41 marriages and 46 births are recorded. Of 5,410 pupils in public schools, 120 were reported sick during the month. Mean temperature, 59°.5; highest, 76°; lowest, 51°; mean daily range, 12°.3; mean humidity, 86.8.

The secretary of the State board of health remarks that the month of July has been marked by unusual exemption from epidemic diseases in California, and a low death-rate in all the cities. A wet winter is there regarded as the precursor of a healthy summer.

THE RELATION OF CLIMATE AND DISEASE.

Dr. R. A. Cleemann, of Philadelphia, makes the following comments upon the subject of climate in its relation to disease, as treated in the paper of Prof. Cleveland Abbe, published in No. 3, Vol. II, of the BULLETIN:

Professor Abbe in discussing the subjects submitted to him by the National Board of Health is in error, I think, in attributing so much importance to sudden meteorological changes as affecting for ill the death-rate.

Nevertheless, for reasons which will presently appear, I applaud his advice to record the daily maxima and minima of the meteorological observations, instead of merely a daily mean, understanding, of course, that the actual values of the maxima and minima are given—not alone their difference, the range. The expression of these items in curves is the most natural one, and great simplicity is attained in making the record but once daily by means of the apparatus he recommends.

The injunction for dealing with such records, however, namely, that "we must first inquire as to the cause of the disease from the experimental student of physiology, and as to what climatological features are of importance, and then turn to the meteorological records to find them it we can," though admirable from a scientific point of view, is, I fear, of too limited applicability in the present inchoate condition of experimental physiology.

Yet of the principles he lays down to guide us after this method, I give cordial assent to the first, that long-continued extreme hot weather, with light winds and calms (though I look upon the latter as very secondary), produces nervous debility.

But I take issue with our author, as I have hinted above, as to the baneful effects of sudden climatic changes, an idea which crops out all over his paper. On the contrary, I believe that such changes are often beneficial, as when after a prolonged season of high temperature in summer a fall takes place in the thermometer, or when in winter a succession of very cold days is broken by a rise in the mercury. If the position of Professor Abbe were the true one, we would expect to find the death-rate higher in that period of the year when the climate is less equable, and lower in that when the greater changes occur. But the reverse is the case. To speak only in general terms, the mortality in Philadelphia is greatest in the summer when the daily range of the thermometer is least, while in London the largest number of deaths occurs in the winter, the period of the least range of the mercury. These facts seem to show that the better view finds danger to health in the continuance of extremes of heat and cold (and presumably in the same of the other elements of climate). But these extremes are probably relative, having reference to the monthly or daily averages through many years of any particular climate. I believe it can be shown that a degree of temperature will cause the death-rate to rise in London which would be unfelt in Philadelphia; the explanation of which I recognize in the theory of acclimation.

Holding such views I approve the record of both minima and maxima observations, because it aids in the detection of breaks in the continuity of heat or cold which will prove favorable, not disastrous, and I insist upon taking the actual values of the maxima and minima, since it is important to know how these compare with their usual values at the same season of the year.

It seems to me that Professor Abbe is hardly just to the plans of dealing with statistics adopted by Mr. Buchan and Dr. Mitchell in their elaborate paper, which he quotes. After showing, as these gentlemen have done, the coincidence year after year of certain meteorological conditions with certain events, they make a legitimate induction when they say these stand in the relation of cause and effect, which can only be swept away by another farther reaching induction. But has this been elicited as yet? And the syllogism is very rigid which he has designed to disprove the effect of heat in causing diarrhœa as advanced by Messrs. Buchan and Mitchell. He suggests as a necessary minor premise, "every other conceivable cause has been examined and proven to be harmless," and declares that "certainly no one will be found to assert the truth of this premise." No one will be found, perhaps, to assert that every other conceivable cause is harmless, but many, I believe, will stand by the statement that every other probable cause, as far as examined, has been found insufficient to explain the extensive prevalence of diarrhœa in hot weather. Hence the conclusion that heat is a very prominent factor in the causation of diarrhœa may be looked upon as at least provisionally true.

In my opinion, "acid fruit, unripe fruit, soured milk, tainted milk and food" are all too partial causes, while "spore dust in the atmosphere," though very attractive in speculation, is yet too visionary a thing to be brought forward seriously. Further investigations may show that the latter is a real disturbing entity, invading air, or food, or drink, as the poison of typhoid fever is supposed to do—a disease which has been shown to bear, like cholera infantum, though in a less defined degree, a relation to the amount of caloric in the atmosphere; but, till these are more numerous and confirmatory, is it not wiser to be chary in putting too much weight upon it?

Professor Abbe, in opposition to the agency of heat in determining cholera infantum, and, indeed, to show that the disease may result from the opposite condition of cold, offers a diagram in which he has placed the mortality from cholera infantum in Philadelphia, as deduced from weekly statements, in relation with the curves of the daily maxima and minima of temperature at Washington. A chart thus constructed is somewhat inaccurate, so that I have substituted one in which are represented the daily record of the deaths from cholera infantum and the curves of the daily maxima and minima of temperature at Philadelphia, the meteorological data for which were kindly furnished me by Prof. J. A. Kirkpatrick, of this city.

From the corrected chart it appears that the mortality from cholera infantum culminated about July 1-9, while the period June 28-July 5, was distinguished by the highest temperature of the year as well as by continuity of heat as represented by a mutual approach of the maximum and minimum curves of temperature. Depressions of temperature had preceded the great rise, in June 15-18, and on June 24-26, though on neither of these occasions was the maximum below 75° F., while only on the 17th did the minimum fall as low as 63° F., the minimum on June 27 being as high as 67° F.

Professor Abbe would refer the increased mortality of July 1-9 to the "remarkable sudden fall of temperature" on June 15-18, on the ground that "the actual mortality occurs always some time after the disease has taken hold upon the child." If he were correct the average duration of *fatal* cases of cholera infantum at this season of the year—including entero-colitis and what is known as true cholera infantum, for the latter term in the register embraces both of these—would be from two to three weeks. But this certainly is not my experience, nor can I find any authorities giving so long a period. Some cases reach their end in death in one, two, and three days, especially such as occur in the hottest weather, and though the majority do continue longer, yet, I repeat, if they are to terminate fatally, my experience is against so long a course for the average as two to three weeks.

Our author's description of the sequence of events in the chain of

causation appears to me, and I presume will to most other physicians, rather fanciful and far-fetched: "The sudden change from hot to cold on this date [June 22–24 on his diagram, the maximum mortality being represented there as on July 6–14] was the cause of many infants or their mothers taking cold which settled in the bowels, and that the disease ran along with no more than the ordinary mortality, until the sudden increase of heat on July 6 caused the mothers to yield to the temptation of a change of diet from one of animal food and ripe vegetables to one of fresh vegetables and fruit, a change which assuredly affects the babe far more than the direct influence of temperature." Here are four distinct propositions: First, that in such a fall of temperature as indicated many infants "took cold"; second, that the cold "settled in the bowels" (why should it attack this part, especially at this season of the year?): third, that a sufficient number of mothers changed their diet to influence to this degree the mortality from cholera infantum; and fourth, that such a change "affected the babe far more than the direct influence of the temperature." It would take me too far to discuss specifically all these propositions, none of which would be generally accepted, and in support of which no other proof is offered than that furnished by the relations in the diagram above pointed out, though Professor Abbe asks that some one should attempt the discovery of some testimony for the third proposition by "comparing the statistics of cholera infantum with the daily sale of cherries, cucumbers, green apples, &c."

Professor Abbe also objects to the heat-causation theory of cholera infantum, that "the equally hot or hotter periods in May 6–12, June 6–11, August 7–15 and 17–27, and September 6–10 were not attended by any special increase, but rather by a very decided decrease or absence of cholera infantum." My chart shows that there were no periods as hot as that from June 28 to July 5, closely followed on July 1–9, by the maximum mortality from cholera infantum. Yet there were seasons in May, August, and September when the thermometer ranged very high, and there was no excessive mortality from cholera infantum. But this is not an unanswerable argument against the causative agency of excessive heat, for the reply may be made that the hot term in May found the infantile nervous system equal to resist the heat, toned up as it was by the low temperature of the previous winter, an effect of cold well recognized by the physiologist; on the other hand the hot periods in August and September came at a time when the more feeble children had already succumbed, and the stronger had become in a measure acclimated to a high temperature.

It seems to me that Professor Abbe has not refuted the proposition that heat is the chief cause of cholera infantum, the belief which finds the most acceptance among etiologists, and one which may be brought in accord with a principle enunciated by Professor Abbe himself, and commended above, namely, that long-continued extreme hot weather produces nervous debility. Whether such an effect comes about through altered blood or by a direct action upon the nervous system, it is well known that in infants a weakened sympathetic is the result, which leads to imperfect or depraved secretions in the alimentary canal; and in proportion to the change in the secretions and the inappropriateness of the food ingested are developed the various degrees of the disease known in America under the generic title cholera infantum, and in Europe under those of summer diarrhœa, sporadic cholera, &c. However, that the food is but a secondary cause is proven by the fact that articles of diet, such as farinaceous substances which may be kept sweet, are eaten by infants with impunity for a long time in the cold season, but are at once followed by diarrhœa in summer.

ABSTRACTS FROM CONSULAR REPORTS.

ALEXANDRIA, EGYPT, *August* 5.—A report is forwarded from Nerouts os Bey, M. D., president of the Egyptian general board of health, giving the detailed quarantine regulations for vessels carrying pilgrims to and from Arabian ports on the Red Sea. The principal station is at Tor, and a quarantine of from 10 to 15 days is ordered for all vessels infected with cholera or plague.

CONSTANTINOPLE.—United States Consul G. H. Heap, under date of August 20, forwards reports of the sanitary board, and also bulletins of epizoötic diseases. From these it appears that the famine in the provinces is at an end, and the attendant diseases are disappearing. No epidemic disease prevails among cattle.

LIBERIA, AFRICA.—The United States vice consul-general informs the State Department that it is not possible to obtain at Monrovia the data for reports to the National Board of Health. No records of diseases or deaths are kept by the authorities, and at least half of those who die have no medical attendance. More than three-fourths of the towns and settlements in Liberia have no regular physicians, and the so-called "country doctors," using roots and herbs, are credited with nearly as many deaths as are caused by disease. Efforts will be made by the consul to obtain information.

SANTA CRUZ, PALMA, CANARIES.—United States Consul F. W. Lavers reports, for the month of July, 11 deaths in a population of 6,070, giving an annual rate of 21.7 per thousand. The causes of death are not given, but no contagious disease is reported.

SINGAPORE.—United States Consul A. G. Studer forwards a report for the month of June, giving a total of 296 deaths, of which only 5 were among Europeans. Among the causes of death were, fever 82, diarrhœa and dysentery 40, consumption 28, and rheumatism 14. No epidemic disease in the district.

TALCAHUANO, CHILI.—The United States consul reports that this is usually one of the healthiest towns on the coast, but in April last small-pox was brought there by a vessel from the north, and until recently the disease has raged to an alarming extent. In May there were 136 deaths from this cause, mostly children. The consul had under his own care 25 cases of seamen and deserters from vessels; of these, but few died.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

CHARLESTON, S. C., September 10.—Dr. F. Irwin reports an epidemic of *dengue* fever, there being about 2,000 cases in the city.

FAIRFAX COURT-HOUSE, VA.—Under date of September 2, Dr. R. W. Dorsey states that from early in May to the middle of July cholera infantum was very fatal in that place. One case of typho-malarial fever is reported at Vienna, a place 5 miles north of Fairfax Court-House, where a number of cases occurred last year. The village is badly located, on swampy land, and but little attention is given to sanitary conditions.

HAVANA, CUBA.—During the week ending September 3, 25 deaths from yellow fever were reported, and for the month of August there were 158 deaths from that disease. Most of the vessels discharging at the wharves at this season become infected, but on removing to the open bay, and using fumigation and other means of disinfection, they may be freed from the poison.

HOLLY SPRINGS, MISS.—Dr. F. W. Dancy, under date of September 9, reports only five deaths for the three summer months, one from consumption, one from diabetes, one from dysentery, one from paralysis, and one from accident. The population is stated at 2,360.

KANSAS CITY, MO.—Dr. J. H. Van Eman, under date of September 10, states that there has been less sickness among children than usual during July and August. At present a form of fever is prevalent which is of a malarial and typhoid type, frequently fatal, and not controlled by quinine.

NAVASOTA, TEX.—Under date of September 2, Dr. A. R. Kilpatrick reports an unusual mortality for the months of July and August, chiefly due to malarial diseases. Four deaths were of white persons, 2 being adults. Five colored persons died, 3 of whom were adults. Of the 9 deaths in July 2 were from consumption, both colored; of the 3 deaths among colored children, 2 were from marasmus and 1 from accident. In August there were 10 deaths, 8 white and 2 colored. Malarial fever caused 6 of the deaths among the whites. In July rain fell on 10 days; the temperature ranged from 66° to 94°. In August rain fell 8 days, mostly moderate showers; the thermometer ranged from 66° to 100°. Ophthalmia has been prevalent all the summer.

NEW LONDON, CONN., September 10.—Dr. J. G. Stanton reports the prevalence of diphtheria of a very fatal type.

NEW ORLEANS, LA.—Dr. S. H. Collins writes, under date of September 3, that the change to cooler weather has greatly lessened the number of cases of *dengue* fever. Dr. Bemiss reports that many cases occurred at Biloxi and vicinity. The fever this year is marked by pains, lasting from 15 to 30 hours, being shorter than usual, and the absence of eruption. Congestion of the kidneys has been noted, but no albumen in the urine. The disease is rarely fatal. In New Orleans the fever has been chiefly confined to one district. Malarial fevers are prevalent throughout the country, but readily yield to quinine.

SALEM, FAUQUIER COUNTY, VA, September 4.—Dr. F. Horner, jr., writes that a fatal form of diphtheria prevails in that place, among white and colored children occupying certain tenement houses having floors near the ground. The water used by the inmates of these houses is from wells which contain much filth, and are never cleaned out.

INSPECTORS' REPORTS.

BAY SAINT LOUIS, MO.—Dr. E. Latham, sanitary inspector, reports, under date of September 2, that *dengue* fever is epidemic at that place. It has been already noted as prevailing in New Orleans.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING SEPTEMBER 4, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

States and cities.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Consumption.	Croup.	Diarrhœal diseases.	Diphtheria.	Fever. Enteric.	Fever. Youngstown, Ohio, 15,089; deaths, 8; under 5 years, 5; diarrhœa 7. Total population, 428,662; deaths under 5 years, 57; total number of deaths, 149; annual rate per 1,000, 18.1.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, SEPTEMBER 25, 1880. [No. 13.

MONTHLY REVIEW OF MORTALITY FOR AUGUST, 1880.

The mean population represented in the reports for August was 92,600 more than that for the preceding month, the increase being partly due to the placing of several towns in the table which were formerly excluded, but now require burial permits. The general mortality of the country has been reduced since last month from 26.66 to 21.56, the decrease being chiefly in diarrheal and other heat diseases. These have been noted as beginning to decline since July 3, when the deaths from such diseases reached their maximum rate of 12.6 per 1,000 per annum. The rate of infant mortality has fallen from 14.46 to 10.24, or nearly 30 per cent., while the general rate has not been reduced quite 20 per cent. The following table shows the rates of mortality from the diseases noted.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Week ending—	Population.	Total deaths.	Annual rate per 1,000.	Deaths under 5 years.	Annual rate per 1,000.	Per cent. of deaths.	Consumption and lung diseases.			Consumption.			Lung diseases, acute.			Diphtheria and croup.			Diphtheria.

Causes of death.—The class of diarrheal diseases still shows the highest death-rate, but it is steadily declining, and the mean rate is little more than half of that for July. Consumption and lung diseases have declined in nearly the same proportion, the rate of mortality from both being 11 per 1,000 less than it was in July. The zymotic diseases show greater changes; enteric fever continues to increase, having advanced from 0.39 to 0.49, or nearly 33 per cent. This increased rate is more than balanced by the fall of measles from a rate of 0.20 to 0.09 per 1,000; whooping-cough has declined from 0.27 to 0.24, while diphtheria and scarlet fever show no change since last month. Croup is rather more prevalent than in July, the rate having advanced from 0.20 to 0.23.

Distribution of diseases.—During the summer months there has been a general decline in the death-rate of all pulmonary diseases, that of acute lung diseases having shown the greater reduction. Both classes continue to fall in the Northeast and Southeast sections; but both show an increased rate in the Northwest, which probably results from the earlier change of season in the more elevated portions of that inland section. Croup has increased in all sections, but diphtheria shows a marked decline in the Northwest, with a small increase of mortality in the other sections. The rate of deaths from measles continues to fall in all parts of the country, and scarlet fever has advanced only in the Northwest. Whooping-cough has begun to fall in its rate of mortality for all sections, the most marked decline being in the Southeast, where the disease had spread extensively, and in July reached a death-rate of 0.50; it falls to 0.40 this month. The increase of enteric fever, noted last month, still continues in all sections of the country, the advance being most marked in the Northwest; this may be ascribed to the earlier change of season in that section, as referred to in connection with the increase of mortality from acute lung diseases, enteric fever being notably an autumnal disease in this country. Malarial fevers being in the same class, as to season, a general increase is noted in all sections, being most marked in the Northeast and Northwest, where the temperature required to develop the cause appeared latest. The change of death-rate from diarrhœal and other summer diseases does not necessarily follow the temperature in their decline so closely as in their inception, many deaths occurring from a sudden fall of temperature acting upon subjects previously prepared by the exhausting effects of the heat. The reduction of death-rate from diarrhœal diseases has been greatest in the Northeast, where it had been highest. Since July the rate has fallen 40 per cent. in that section, 30 per cent. in the Southeast, and 20 per cent. in the Northwest. It has been noted that other influences than temperature control the movement of this class of diseases. The epidemic of small-pox at Camden, N. J., has furnished 24 out of the 39 deaths reported; Philadelphia reports 13, and Chicago and San Francisco report 1 each. A report of Asiatic cholera in Erie, Pa., caused some alarm, but no case of that disease has been proved to exist in the country this season. Indiana, Tennessee, and adjoining States have reported extensive prevalence of typho-malarial fevers, but usually not of very fatal type. No yellow fever has appeared at any of the exposed points of the coast, the few deaths reported during the month having occurred on infected vessels or in quarantine hospitals. The fever known as *dengue* has prevailed along the Lower Mississippi and the Gulf coast and in Charleston, S. C., but the mortality was generally small.

ORIGIN AND GROWTH OF THE QUARANTINES OF THE SEA-BOARD STATES OF THE UNITED STATES.

QUARANTINE LEGISLATION IN THE STATE OF CALIFORNIA.

[By Henry Gibbons Jr., M. D., San Francisco, Cal.]

Prior to 1865, it appears that no quarantine laws or special sanitary regulations were adopted. No record of deaths, even, was kept by the authorities, the undertakers alone having charge of that matter.

April 3, 1865, the board of supervisors of San Francisco passed an order providing for a board of health, under whose authority Dr. J. M. McNulty was appointed, October 30, 1865, health officer. He thereupon organized the health office, &c.

April 2, 1865, the legislature passed an act to establish a quarantine for the bay and harbor, and sanitary regulations for the city and county of San Francisco. Under this act, Dr. S. F. Elliott was appointed in June, by the governor, quarantine officer (salary $1,200 per year). Dr. S. F. Elliott was, thus, the first quarantine officer. He was not obliged to board vessels unless cases of contagious diseases were on board, in which event the officers of the vessel were required to anchor their vessel in the stream and to report its condition to the quarantine officer at his office in this city.

In 1868 Dr. C. C. Gordon was appointed quarantine officer by the governor, vice Dr. Elliott, and soon after he was authorized by the board of supervisors to appoint Dr. P. H. Humphrey his assistant, the latter to depend on the fees for his salary and the expenses of boat.

In 1870 the quarantine law was so modified as to give the appointing power to the San Francisco board of health, and to require all vessels to be boarded by the quarantine officer on their arrival in port, and before landing at the wharf.

Under this law Dr. W. H. Rogers became quarantine officer. He was succeeded in 1871 or 1872 by Dr. J. L. Mears, who in turn gave place to Dr. P. H. Humphrey in 1874. Dr. W. F. McAllister followed Dr. Humphrey in July, 1876, and was in August, 1880, succeeded by the present incumbent, Dr. W. M. Lawlor.

The duties of the quarantine officer, fees, charges, &c., are best understood by reference to the quarantine law and reports of health officers, copies of which I will forward.

As regards "location," our quarantine has none—we possess little more than a name. We have been unable to obtain any grounds or appropriation for buildings, but I must add that I do not think that much effort to secure them has been made prior to the present year.

When a vessel arrives in port with cases of small-pox on board, it has been the custom to remove such cases to our small-pox hospital, and to order the vessel out in the stream for a sufficient time, two or three weeks, as will assure us that no other cases are likely to develop. When this period has elapsed the passengers and vessel are purified and fumigated, and the former allowed to land and the latter to discharge cargo. This is the best we can do. It is a serious hinderance to commerce, and entails great expense upon ship-owners. In one instance it cost the Pacific Mail Steamship Company $20,000 or $30,000.

The present San Francisco board of health, in conjunction with the State board, has been endeavoring to obtain a site for quarantine station. We had the assurance of assistance from the National Board and received it, but thus far have accomplished nothing. All of the government locations about the harbor have been considered. Some are not suitable; others are required for purposes of fortification, and the balance for military uses.

A week ago a party consisting of Representative Horace Davis, United States Engineers Mendell and Stewart, and members of the board of health went on a tour of inspection, the principal object being to examine Peninsula Island, the only place the government is likely to give; but we found it rocky, abrupt, and quite unsuitable. Without extensive and expensive grading we could not get a foot of level ground, and although it might be possible to provide for a small hospital and houses for passengers, it would be next to impossible to find a location for a warehouse for the storage of freight, or buildings for fumigating purposes, &c.

QUARANTINE LAWS OF CALIFORNIA.

Section 3004. The quarantine grounds of the bay and harbor of San Francisco are at the anchorage of Sausalito.

Sec. 3005. The board of health for the city and county of San Francisco consists of the mayor of the city and county and four physicians in good standing, residing in the city and county of San Francisco, appointed by the governor, and holding their offices for the term of five years.

Sec. 3009. The board of health must appoint a quarantine officer, who shall be a physician in good standing.

Sec. 3013. Shipmasters bringing vessels into the harbor of San Francisco, and masters, owners, or consignees having vessels in the harbor which have on board any cases of Asiatic cholera, small-pox, yellow, typhus, or ship fever, must report the same, in writing, to the quarantine officer before landing any passengers, casting anchor, or coming to any wharf, or as soon thereafter as they, or either of them, become aware of the existence of either of the diseases on board of their vessels.

Sec. 3014. No captain or other officer in command of any vessel sailing under a register arriving at the port of San Francisco, nor any owner, consignee, agent, or other person, having charge of such vessel must, under a penalty of not less than one hundred dollars, nor more than one thousand dollars, land, or permit to be landed, any freight, passengers, or other persons, from such vessels until he has reported to the quarantine officer, presented his bill of health, and received a permit from that officer to land freight, passengers, or other persons.

Sec. 3015. Every pilot who conducts into the port of San Francisco any vessel subject to quarantine, or examination by the quarantine officer, must—

1st. Bring the vessel no nearer the city than is allowed by law.

2d. Prevent any person from leaving and any communication being made with the vessel under his charge until the quarantine officer has boarded her and given the necessary orders and directions.

3d. Be vigilant in preventing any violation of the quarantine laws, and report without delay all such violations that come to his knowledge to the quarantine officer.

4th. Present the master of the vessel with a printed copy of the quarantine laws, unless he has one.

5th. If the vessel is subject to quarantine, by reason of infection, place at the mast-head a small yellow flag.

Sec. 3016. Every master of a vessel subject to quarantine or visitation by the quarantine officer arriving at the port of San Francisco who refuses or neglects either—

1st. To proceed with and anchor his vessel at the place assigned for quarantine when legally directed to do so; or,

2d. To submit his vessel, cargo, and passengers to the quarantine officer and furnish all necessary information to enable that officer to determine what quarantine or other regulations they ought, respectively, to be subject; or,

3d. To report all cases of disease and of deaths occurring on his vessel, and to comply with all the sanitary regulations of the bay and harbor,

Is liable in the sum of five hundred dollars for every such neglect or refusal.

Sec. 3017. All vessels arriving off the port of San Francisco from ports which have been legally declared infected ports, and all vessels arriving from ports where there is prevailing at the time of their departure any contagious, infectious, or pestilential diseases, or vessels with decaying cargoes, or which have unusually foul or offensive holds, are subject to quarantine, and must be, by the master, owner,

pilot, or consignee, reported to the quarantine officer without delay. No such vessel must cross a right line drawn from Meiggs' Wharf to Alcatraz Island until the quarantine officer has boarded her and given the order required by law.

SEC. 3018. The quarantine officer must board every vessel subject to quarantine or visitation by him immediately on her arrival, make such examination and inspection of vessel, books, papers, or cargo, or of persons on board, under oath, as he may judge expedient, and determine whether the vessel should be ordered to quarantine, and if so the period of quarantine.

SEC. 3019. No captain or other officer in command of any passenger-carrying vessel of more than one hundred and fifty tons burden, nor of any vessel of more than one hundred and fifty tons burden having passengers on board, nor any owner, consignee, agent, or other person having charge of such vessel or vessels must, under a penalty of not less than one hundred dollars nor more than one thousand dollars, land or permit to be landed any passenger from the vessel until he has presented his bill of health to the quarantine officer and received a permit from that officer to land such passengers, except in such cases as the quarantine officer deems it safe to give the permit before seeing the bill of health.

SEC. 3020. The following fees may be collected by the quarantine officer: For giving a permit to land freight or passengers, or both, from any sailing vessel of less than five hundred tons burden from any port out of this State, two dollars and fifty cents; over five hundred and under one thousand tons burden, five dollars; each additional one thousand tons burden, or fraction thereof, an additional two dollars and fifty cents. For steam vessels propelled in whole or in part by steam, of one thousand tons burden or less, five dollars, and two dollars and fifty cents for each additional one thousand tons burden, or fraction thereof; but vessels not propelled in whole or in part by steam, sailing to and from any port or ports of the Pacific States, of the United States, or Territories, and whaling vessels entering the harbor of San Francisco, are excepted from the provisions of this section.

SEC. 3021. The board of health may enforce compulsory vaccination on passengers in infected ships, or coming from infected ports.

SEC. 3022. The board of health may provide suitable hospitals, to be situated at or near Sausalito, and furnish or supply the same.

RESOLUTIONS OF BOARD OF HEALTH.

Resolved, That all vessels arriving from China be required to come to anchor in the bay, and that all passengers be mustered on deck in presence of the quarantine officer, and be subjected to a personal examination by him before being permitted to land. (Passed May 26, 1873.)

Resolved, That all vessels arriving at this port be examined by the quarantine officer, except those coming from ports in this State, and those lying north. (Passed May 26, 1876.)

QUARANTINE REGULATIONS FOR GEORGIA AND FLORIDA.

NOTICE TO PILOTS.

ST. AUGUSTINE, FLA., *August* 18, 1880.

Pilots will, in all cases, before boarding, make inquiries as to the sanitary condition of the vessel destined for this port. Vessels with sickness on board, or on which serious cases have occurred during the voyage, will be ordered to proceed at once to the national quarantine station at Sapelo.

All other vessels will be brought to at the quarantine station at the north end of Anastalia Island or Black Point, for examination by quarantine officer of this port.

GEO. S. GREENE,
Mayor of St. Augustine and President of the Board of Health.

MAYOR'S OFFICE, JACKSONVILLE, FLA.,
August 18, 1880.

Pilots will, in all cases, *before boarding*, make inquiry as to the sanitary condition of the vessels destined for this port.

Vessels with sickness on board or on which serious cases have occurred during the voyage will be ordered to proceed at once to the national quarantine station at Sapelo.

All other vessels will be governed by the quarantine laws now in force.

By order of the board of health.

J. RAMSEY DEY,
President Board of Health and Mayor of Jacksonville.

(Copy, assumed as correct by W. H. Elliott.)

OFFICE BOARD COUNTY COMMISSIONERS,
Darien, Ga., September 4, 1880.

Pilots will, in all cases, *before boarding*, make inquiry as to the sanitary condition of the vessels destined for this port. Vessels with cases of sickness on board, or on which serious cases have occurred during the voyage, will be ordered to proceed at once to the national quarantine station at Sapelo. All other vessels will be brought to, as at present required by the port physician, at Doboy Island.

By order of the board.

SPALDING KENAN, *Clerk.*

CHARLESTON, S. C.—Dr. F. P. Porcher, under date of September 16, gives the following account of the "break-bone" fever in that city:

At your request we furnish a brief sketch of the comparatively mild epidemic of break bone fever which still prevails in this city. In the opinion of some of the physicians who have taken a retrospective glance, some cases were seen as early as the end of June last, though the disease was not generally recognized till some four weeks since.

It began, it appears, in the extreme northwestern portion of the city, above Calhoun, near Line and Columbus street, in what was formerly called the "Neck." Afterwards it seemed to progress into the lower or oldest part, and there is every indication that it is now diminishing.

The earth had been disturbed in the paving of King street, an extensive thoroughfare running north and south the entire length of the city; and the special section of the city where the first cases were noticed was not in as good a condition as others, being near the marshes and new streets having been opened there; but though we were at first inclined to search for the causes of disease in these conditions, the simultaneous appearance of the fever in the west, and as we learn in Savannah and Augusta, must exclude such a supposition, and refer it to general and wide-prevailing atmospheric influences.

Besides our own experience, which has been limited on account of temporary absence, we have made diligent inquiries of many persons, of physicians as well as the laity, and learn the following particulars, which we present in default of a more complete report, which will doubtless be made in future.

The symptoms vary exceedingly—some being present and some absent—as follows: The disease generally begins with a feeling of coldness, or by a chill, followed by fever—this, with a temperature ranging from 100° to 105°, lasts generally from 24 to 48 hours, occasionally extending to four or five days, and even in rare cases to seven. Relapses occasional, specially in those who have gone out too early. Headache frequent, generally frontal, from the beginning. Miliary eruptions, sometimes elevated and red, like measles, and the occasional presence of *sudamina over the face, neck, and body*; sometimes the eruptions were confined to the body, and endured for days after recovery. We have seen some examples of slight desquamation—furfurations or branny in character. Sweating profuse in many persons, though *often absent*. Hence, some physicians are inclined to consider the disease to be *suetle miliare* of a mild form. "Break-bone" is the best name, because pain in the bones and limbs is the most constant symptom. There is often great restlessness during the fever, and in some a feeling of tightness or congestion about the throat, with bleeding in a few cases known to us. Catarrhal symptoms are rarely present, although cough has occasionally existed. Bleeding from the nose not unusual in children, and also increase in the menstrual molimen has been observed. Pain in the back and limbs markedly present, but no decided swelling of joints, no carbuncular enlargements or boils, as in the epidemic of Dengue, of 40 years since, or in that of "break-bone," which followed some years subsequently. Weakness and prostration have been very decided, but not nearly to such an extent as in previous epidemics. Some of the physicians consider that there has been a tendency to hepatic torpor or congestion, of no great severity, however. We have heard of no cases of decided jaundice. Nausea and vomiting seldom occur.

The disease does not affect all the members of a household, oftentimes only one or two being seized, though we have known six to be taken in one house; in this respect differing from the dengue, as described by Prof. Dickson, and from the epidemic seen by us some thirty years since. Then 10,000 were down; no one was well enough or strong enough to help his neighbor, and one had to learn to walk over again.

It is difficult to calculate the number who have suffered, as very many have not employed a physician; from 2,000 to 3,000, perhaps, approximates the number.

Very little active treatment has been used; as far as we can learn, as follows: A mild laxative, saline or mercurial, hot teas, niter, pediluvia, synapisms, &c., and quinine during and after the attack, upon theoretical grounds, with occasionally mild stimulants. Several persons have recovered with no treatment whatever.

It has prevailed among both races, perhaps equally, and *not a single death is ascribed to this disease* as far as we can learn. The only disadvantage which accrues to those who take it is the time lost and the temporary pain and weakness from which they suffer.

Persons who were in the city and who visited the country had mild attacks. We know of four such; one of these had reached Asheville, N. C., where we saw him. Cases of the fever have occured in

Summerville, thirty miles off, on the line of the South Carolina Railroad, among persons who had never visited the city; others sickened there who had paid flying visits, remaining a part of a day only.

How different all this is from yellow fever, in which a fever of far less apparent intensity produces great changes in the blood and tissues, black vomit, albuminuria, and frequent deaths.

We append the bill of mortality for Charleston for the week ending Septe ober 11:

"BILL OF MORTALITY.—Return of deaths within the city of Charleston for the week ending September 11, 1880: Whites 7, blacks and colored 18—total 25, excluding 3 still-borns, all colored. Under 1 year of age, 2 white and 9 colored; between 1 and 5, 3 colored; between 5 and 10, 1 colored; between 10 and 20, 2 colored; between 30 and 40, 1 white and 2 colored; between 40 and 50; 2 white; between 60 and 70, 1 white; between 70 and 80, 1 white and 1 colored."

Dr. John T. Nagle makes the following report of the mortality in the city of New York, for the second quarter of the year 1880:

I have the honor to report that the total number of deaths for the three months ending June 30, 1880, was 8,632, which is an increase of 2,026, compared with the number of deaths during the corresponding three months of 1879, and represents an annual death rate of 28.68 per 1,000 of the population (according to the United States census of June, 1880, which was 1,203,823).

The increase of the mortality during the second quarter of 1880, compared with the second quarter of 1879, was from the following diseases, viz: Measles, 115; diphtheria, 90; membranous croup, 92; typhoid fever, 13; typhus fever, 1; puerperal diseases, 24; diarrhœal diseases, 891; alcoholism, 18; cancers, 32; phthisis pulmonalis, 84; bronchitis, 99; pneumonia, 264; diseases of the heart, 17; marasmus and scrofula, 57; meningitis and encephalitis, 58; convulsions (infantile), 58; sunstroke, 52; apoplexy, 37; all diseases of the nervous system, 201; Bright's disease and nephritis, 45. The deaths by suicide exceeded by 16 and drowning by 31 the number that took place during the corresponding quarter of 1879, and the deaths of inmates of public institutions were 389, and of residents of tenement houses* 1,195 more than the number reported for the second quarter of 1879. The deaths of children under 5 years of age were 4,195, whereas in the corresponding quarter of 1879 there were but 2,853 deaths at the same age. The mean temperature† for April was 50°.02 Fahr.; for May, 67°.91 Fahr., and for June, 73°.14 Fahr. The depth of rain-fall by inches in April was 2.90; May, 0.62, and June, 1.14; and the velocity of the wind by miles was 5,202 in April; 4,415 in May, and 4,305 in June. The causes which tended to increase the mortality of the second quarter of this year are chiefly attributed to the increase in population and the high temperature, the range being as high as 96° Fahr. on May 27, at 4 p. m., and 95° each on May 25 and 26, at 4 and 5 p. m., respectively, and on June 25 and 28 at 94° at 4 p. m. The deaths from diarrhœal diseases of children under 5 years of age in April were 40; May, 101, and in June they arose to 1,120. The deaths in tenement houses were 1,254 in April; 1,106 in May, and 1,999 in June. The total deaths from zymotic diseases during the three months was 2,580, against 1,683 for the second quarter of 1879. The total number of deaths during the second quarter of 1880 from small-pox was 2 (both immigrants sent from quarantine hospital); measles, 161; scarlatina, 114; diphtheria, 218; membranous croup, 175; whooping cough, 68; typhus fever, 1; typhoid fever, 42. The highest daily mortality occurred on the 26th of June (232), and the lowest on the 9th of June (58). The highest number of deaths of children under 5 years of age was on June 25 (175), and the lowest number was on April 21 (21).

* Houses which contain more than 3 families living separately.
† From New York Meteorological Observatory, Central Park, D. Draper, Ph. D., director.

Comparative table of mortality from the principal causes of death in the second quarter of the year 1880, with the corresponding quarter of the preceding five years.

Causes of death.	1880.	1875.	1876.	1877.	1878	1879.	Total for 5 years preceding 1880.	Average for 5 years preceding 1880.
Total deaths from all causes	8,632	7,064	6,704	6,047	6,334	6,606	32,755	6,551.0
Total zymotic diseases	2,580	2,163	1,986	1,560	1,567	1,683	8,961	1,792.2
Total constitutional diseases	1,726	1,496	1,454	1,403	1,564	1,521	7,438	1,487.6
Total local diseases	3,384	2,625	2,523	2,423	2,564	2,652	12,787	2,557.4
Total developmental diseases	510	437	437	361	374	470	2,079	415.8
Deaths by violence	432	341	304	300	265	280	1,490	298.0
Small-pox*	2	462	100	8	1	11	582	116.4

* Both immigrants, sent from Quarantine Hospital.

Comparative table of mortality, &c.—Continued.

Causes of death.	1880.	1875.	1876.	1877.	1878.	1879.	Total for 5 years preceding 1880.	Average for 5 years preceding 1880.

This case was sent from Quarantine Hospital to Riverside Hospital, where death occurred. The patient came in the steamship *Mikado*, and was never vaccinated.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough reports, under date of July 10, that the sanitary condition of this city is not good, the drainage and cleansing being defective. This is not the case on the island of Koolangsoo, in the harbor, where the foreign population, numbering about 300, reside. On this island the mean temperature in July is 86°; in winter it ranges from 45° to 68°. The year may be divided into three periods—five months of fine weather, three of wet, and four of variable weather. The mean annual rainfall is about 44 inches. The water is abundant and good, and is carried over to Amoy for sale. The population of Amoy is stated at 300,000. No returns of deaths can be obtained.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports 61 deaths in July, being at an annual rate of 36.6 per 1,000. No contagious diseases reported. Mean temperature, 83.5.

BORDEAUX, FRANCE.—United States Consul L. A. Price reports 460 deaths for the month of July; population, 215,140; annual death-rate, 25.7 per 1,000. Mean temperature for the month, 72°. There were 15 deaths from small-pox, 5 from typhoid fever, and 26 from other contagious diseases.

CARDIFF, WALES.—United States Consul W. Sikes notes a correction made by the health officer in the number of deaths for the week ending August 14. It should have been given as 30, instead of 40. During the week ending August 21 there were 35 deaths—one from scarlet fever being the only one from any contagious disease.

FOOCHOW, CHINA.—United States Consul J. C. Wingate reports no epidemic or contagious disease during the three weeks ending July 10. The sanitary condition of the foreign settlement is good, but that of the city is bad. The population of the city is supposed to be 600,000, with 500,000 in the suburbs.

JAPAN.—Dr. Thomas H. Streets, U. S. N., sends the health report of Kanagawa district for July, recording 2 cases of choleraic diarrhœa, typhoid fever 3 cases and 1 death, and 144 deaths from causes not reported.

MALTA AND GOZO.—For the two weeks ending August 15 the report shows 162 deaths; population, 153,508; annual death-rate, 25.7 per 1,000. The following causes of death are noted: Small-pox, 1; enteric fever, 1; dysentery, 6; diarrhœa, 7; consumption, 8; other lung diseases, 5; still-born, 6, not included in the mortality.

MESSINA, SICILY.—The report for the month of May gives 4 deaths from typhoid fever and 27 from other contagious diseases. The total mortality was 197, in a population of 77,293, giving an annual rate of 30.6 per 1,000. Diphtheria, enteric fever, and consumption are noted as the prevailing diseases.

MOSCOW, RUSSIA.—United States Consul A. Weber reports a death-rate of 48.6 per 1,000 per annum for the month of June, the number of deaths being 2,411. Of these, 470 were from diseases of the respiratory organs, and 835 from those of the digestive system. In May, the death-rate was 44.1, the deaths being 2,246, of which 595 were from respiratory and 423 from digestive disease. Small-pox caused 13 deaths in May and 18 in June; typhoid fever, 164 in May and 126 in June. Mean temperature for May, 55°.

NEW ZEALAND.—The report for the month of June shows a total of 103 deaths in the four chief boroughs. Aggregate population 75,720, and annual death-rate 16.3. Of the 103 deaths, the following causes are noted: Scarlet fever 1, diphtheria 2, whooping-cough 1, enteric fever 2, diarrhœa 3, consumption 12, diseases of the nervous system 13, of the heart 5, of the respiratory system 10, of the digestive system 7, deaths by violence 13.

NINGPO, CHINA.—United States Consul E. C. Lord sends reports for the three weeks ending July 17. During this period the health of the district had been fair, and no contagious diseases are noted.

SANTA CRUZ, TENERIFFE.—United States Consul W. H. Dabney reports for the month of July 30 deaths; of which consumption caused 6, typhoid fever 5, diarrhœal diseases 6, and bronchitis 2. There were 12 deaths under 5 years and 6 over 60 years of age. Births during the month, 33.

SANTA MARTHA, UNITED STATES OF COLOMBIA.—The reports for the two weeks ending July 24 state that the number of deaths cannot be ascertained; no contagious disease prevails, intermittent fever being the most common complaint.

SANTIAGO DE CUBA.—United States Consul J. C. Landreau reports for the month of July 136 deaths from yellow fever, 49 from small-pox, and 12 from typhoid fever. The cases of yellow fever were mostly among the Spanish troops; and the harbor and vicinity being free from the disease clean bills of health were issued.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

SAN ANTONIO, TEX.—Dr. D. R. Menger, city physician, makes the following remarks, under date of August 29 and 31:

The population of San Antonio is estimated by the late census at 20,697, a large proportion being Mexicans, negroes, and foreigners. The city is situated in a valley, on both sides of the San Antonio River. The central portions of the city are well built and inhabited by Americans, while the southwest part is composed chiefly of the Mexican *jacals* or huts, made of a few posts and reeds, and plastered with clay. These huts have no ventilation, save through the doors, the chimney, and sometimes one window. Disease is rife among this population, and they frequently conceal the existence of cases of small-pox and other contagious diseases. From this fact, the estimate of deaths and number of cases of small-pox in the recent epidemic was probably too low. The negroes are much better housed than the Mexicans. The water-supply of the city is generally good, but the hydrants supply only the better class of the population, while the lower class have to use water from ditches and wells, often polluted with filth of all kinds. The natural drainage of the city is good, but the drains are in many places obstructed by weeds and offal, and are only cleansed by the sudden and heavy rains which often occur in summer. The rains, however, injure the sanitary condition of some localities, by forming pools of stagnant water. The privy system is defective, and the advantage of cement lining to privy-vaults is strongly urged, as preventing leakage into wells and cisterns.

VIDALIA, LA.—Dr. J. S. Meng reports, under date of September 11, that there have been eleven cases of dengue fever in that town. The population is estimated at 700.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING SEPTEMBER 11, 1880.

Titusville, Pa., 9,000; deaths, 3; under 5 years, 1; croup 1, accident 2. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; deaths, 3; under 5 years, 2; consumption 1, lung disease 1. Youngstown, Ohio, 15,089; deaths, 7; under 5 years, 2. Total population, 373,593; deaths under 5 years, 54; total deaths, 112; annual rate per 1,000, 12.6.

INSPECTORS' REPORTS.

New Orleans, La., September 9.—Dr. S. H. Collins reports that the fever prevailing about Pointe à la Hache is not yellow fever, but malarial, and yields readily to quinine in most cases.

Dengue is on the decline in New Orleans and along the lower coast. Some cases of yellow fever have occurred.

Brownsville, Tex.—This city and the neighboring Mexican city of Matamoras were in the path of a chubasco or cyclone, which began with a wind from the north early on the morning of August 12, which steadily increased in force till midnight, when it suddenly ceased. After two hours of calm, the wind came from the S.E. and blew until 6 p. m. of the 13th with great violence. The various descriptions of the storm indicate that it has caused great damage and some loss of life. The sanitary condition of the cities and towns in its track is likely to be much injured; that of Matamoras is represented as deplorable by the United States consul, Warren P. Sutton.

Burlington, Vt.—Under date of September 10, Dr. George M. Ockford states that the only epidemic or contagious disease prevailing is whooping-cough, but this has caused only a few deaths. The sanitary condition of the city has been improved by the removal of a soap factory from a central location to the suburbs, but drainage is still defective.

Minster, Ohio, September 18.—Dr. E. F. Wells writes that no contagious diseases prevail in that vicinity, but the usual malarial fevers are mostly of a remittent form, and not readily amenable to treatment. The sanitary condition of the town is good.

Notice.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, OCTOBER 2, 1880. [No. 14.

SANITARY LEGISLATION IN COLORADO.

The following ordinance, providing for the collection of vital statistics has been passed by the authorities of the town of Boulder:

AN ORDINANCE in relation to the record of births and deaths and the issue of permits for burial of the dead.

Be it ordained by the board of trustees of the town of Boulder:

SECTION 1. Each physician, surgeon, and midwife shall keep a registry of every birth in the town at which he or she shall have attended professionally. Said registry shall contain a statement, as near as may be, of the time of birth and the exact locality thereof, the name of the father, the maiden name of the mother, the place of residence of each parent, the occupation of the father, the sex and color of the child, and the fact of its being born alive or dead. In case two or more of such persons shall have attended professionally at any such birth, the one oldest in attendance shall make the registry; but in the absence of any such person, the father or mother of the child shall make such registry and be alike responsible therefor. The registry of any such birth shall be made upon a separate paper and signed by the maker thereof in his or her professional capacity, or otherwise as the case may be. Within seven days from the time of the occurrence of any such birth, the maker of the registry thereof shall deliver it to the recorder and clerk of the town, to be filed by said officer without delay, among the records of the town.

SEC. 2 A book, to be known as the "Record of Births," shall be kept in the office of said clerk, which shall contain suitable columns for the entry of all the facts required in said registry. Said officer shall without delay make a full entry of all of said facts in said book according to its columns and in the alphabetical order of the surnames of the parents.

SEC. 3. Within thirty-six hours from the time of the death of any person within the corporate limits of the town, and before the removal of the same for interment, the undertaker or other person who shall have taken the interment in charge shall obtain a permit therefor from the recorder and clerk of the town by application thereto.

SEC. 4. At the time of the application the person making the same shall present to said officer a certificate that shall contain a statement, as near as may be, of the following facts in relation to any such deceased person, to wit: the date of the death, name, age, occupation, and place of birth as to town, county, and State, the exact locality of the death in the town, the cause of the death, the duration of the disease or other cause of death, the sex, color, and fact of being married or single.

SEC. 5. Said certificate shall be obtained from the physician or surgeon who shall have professionally attended such deceased person up to the time of death. In case two or more of such persons shall have thus attended such deceased person, the one oldest in attendance shall furnish such certificate; but in case no physician or surgeon shall have been in attendance upon such deceased person as aforesaid, then from the health officer of the town, who shall make no charge for such service.

SEC. 6. On request of any proper party intending to make such application, it shall be the duty of any such physician, surgeon, or health officer to furnish such certificate. In case of an inquest, the coroner or other person making the same shall furnish the certificate. The certificate of the health officer shall be sufficient on the failure of any other of said parties to furnish the same. Every such certificate shall have the name of the maker thereof affixed thereto in his professional or official capacity, as the case may be, and the place of his residence.

SEC. 7. Each of said permits shall be numbered in the order of its issue and bear the date of its issue, shall set forth the name of the applicant, the name of the deceased, and time and place of death, and shall be signed by said recorder and clerk, and have the seal of the town affixed thereto. The sum of fifty cents shall be paid by such applicant to said officer for each permit, and the same paid into the town treasury by said officer.

SEC. 8. Said officer shall keep a register of burial permits, in which shall be entered without delay a brief record of such permits in substance.

SEC. 9. Said undertaker or other person shall deliver said permit to the sexton or other person in charge of the cemetery or other place of burial before such interment takes place.

SEC. 10. On Monday of each week every undertaker or other person who shall have taken in charge the interment of any such deceased person shall make a report in writing to said recorder and clerk. Said report shall contain a statement of the number of interments that shall have been made under his charge during the week last preceding that of the report, and all other interments made by him that shall not have been reported before, the name of each of such deceased persons, the date of burial, the name of the sexton or other person to whom any such deceased person shall have been delivered, the exact locality of burial by specific designations through established names of the cemetery and lot, or part of lot, or other divisions therein, and any other place not in a cemetery, and by such other further physical descriptions as may be sufficient to make the grave of one deceased person readily distinguishable from all others.

SEC. 11. At the same time and in the same manner, the sexton or other person acting as such shall make a report of the facts above required from the undertaker with the variation that said last report shall show the number of the permit and from what undertaker or other person any such deceased parties shall have been received. Every such report shall be signed by the maker thereof. In case there shall be no sexton or other person acting as such at the burial of any deceased person, then the undertaker or other person acting as such shall make the report required of the sexton, and such last report shall stand in lieu of both reports required in other cases.

SEC. 12. Each undertaker, sexton, or other person required to make the above reports shall keep a blank book with suitable columns for the entry of the facts necessary to be reported by him, and shall make such entries without delay.

SEC. 13. The provisions of this ordinance shall be deemed to apply to the interment of persons that, after death, shall have been brought within the corporate limits of the town and kept therein for the purpose of being prepared for interment.

SEC. 14. The recorder and clerk shall keep a book in his office, to be known as the "Record of Mortality," in which shall be entered in suitable columns by said officer the substance of said certificates and reports; and the said matters in relation to such deceased persons shall be arranged in said book in the alphabetical order of the surnames thereof. Such entries shall be made without delay.

SEC. 15. In case any report required by this ordinance shall not be made to the recorder and clerk, then it shall be the duty of said officer to make a record of any such birth or death in the proper book of all of the facts required by this ordinance, from his own knowledge or the best information obtainable. It shall be the duty of the town marshal and health officer to assist said clerk in obtaining such information, and to report to the town attorney or the board of trustees every case coming to his knowledge, by information or otherwise, of the infringement of any of the provisions of this ordinance.

SEC. 16. The board of trustees shall cause to be printed, at the expense of the town, a sufficient number of all blank papers and books requisite for the purposes of this ordinance, with appropriate columns according to the use intended for any such paper or book. Said papers and books shall be kept in the office of said recorder and clerk and delivered in sufficient number by said officer to any proper person requesting the same for use.

SEC. 17. Whoever shall violate any of the provisions of this ordinance, or fail to comply therewith, shall be deemed guilty of a misdemeanor, and, upon conviction thereof, be fined not less than five nor more than fifty dollars.

Passed by the board of trustees and approved this 6th day of September, A. D. 1880.

[SEAL.] JOHN A. ELLET, *Mayor.*

Attest.

E. J. MORATH, *Recorder and Clerk.*

SANITARY LEGISLATION IN GEORGIA.

AN ACT to authorize the city council of Augusta to create a board of health for said city.

SECTION 1. *Be it enacted by the general assembly of the State of Georgia and it is hereby enacted by the authority of the same,* That the city council of Augusta be empowered, after the passage of this act, to create a board of health for said city, the members of said board to be appointed by council, and to be composed of such good and discreet citizens and physicians (not to exceed twelve in number) as may best subserve the purposes for which said board is created, said

board to serve without pay or emolument, and to be composed of one citizen from each ward, two physicians from city at large, one chemist, mayor, and health committee, *ex officio*, who shall hold office for such length of time as the city council of Augusta may prescribe.

SEC. 2. That said board shall have full power to institute all sanitary measures necessary to the preservation of the public health, and for the prevention of the generation and introduction of infectious and contagious diseases, yellow fever, small-pox, and cholera. They shall likewise exercise absolute power over the subject of quarantine (personal or otherwise), penalties for the violation of which shall be so fixed by the code of Georgia, or by the municipal regulations, as to be enforced by the recorder's or other court of said city.

SEC. 3. That said board of health shall have only an advisory relation to the city council of Augusta as to any extended system of drainage or other like improvements, the power to recommend for this and other similar purposes being their sole prerogative.

SEC. 4. That the abatement of nuisances, the policing of premises and general inspections, and enforcement or execution of quarantine regulations, shall be done through the municipal authorities, the board of health simply determining the fact of a nuisance existing, the time when, extent of, and the manner in which said acts shall be done; the appointing power of all officers and employés resting with the city council, who shall affix their pay.

SEC. 5. That the necessary expenses of said board of health shall form a legitimate item in the administration of the city government, to be met, as in the case of other expenditures, by such appropriations of money as the city council, in the exercise of a sound economy, may deem proper.

SEC. 6. That the small-pox hospital (or other temporary hospital for contagious diseases) shall alone be under the management of said board of health.

SEC. 7. That the said board of health shall make, annually, to the city council of Augusta, at the last monthly session of said body, a full report of its acts, particularizing its expenditures, and making such recommendations touching the public health and welfare as in their judgment may seem fit and proper; and shall also make such other reports on the same subjects, from time to time, as the said city council may require.

SEC. 8. That the said board of health shall hold at least one session in each month, and shall have power to declare a vacancy in the board when any member, except the city council members of said board, shall fail to attend three consecutive monthly meetings, and to report such vacancy to the city council of Augusta, to be filled as said city council may prescribe; and said board shall be further empowered to pass such by-laws and regulations as may be necessary to secure the efficiency of the organization.

SEC. 9. That a majority of the members of said board of health shall constitute a quorum for the transaction of business (except in times of epidemic visitation, when two members shall have power to act). A record of their proceedings, open to the city council, shall be carefully kept and filed among the archives of the city government.

SEC. 10. That said board of health shall have the power to declare what are infected ports, on information satisfactory to them, public notice of which shall be sufficient to give legal effect to all of their subsequent acts.

SEC. 11. That said board is further authorized and empowered to establish quarantine stations at such convenient distances as it may think best for said city, not exceeding forty (40) miles, and to forbid all persons from coming from infected or contagious ports nearer to said city than said established stations. Said board is also empowered to establish such regulations as to the transportation of all freights of every kind or character whatsoever, coming into or passing through said city, as it may think best calculated to carry out the objects of its creation; and also like power to require the ventilation, disinfecting, cleaning, and other precautionary measures in reference to all cars, engines, boats, and vehicles coming into or passing through said city. Publication of said rules shall be considered sufficient notice, and any person or persons offending against such regulations shall be guilty of a misdemeanor, and be punished as prescribed in section 4310 of the code of Georgia; and, in addition to said penalty, any corporation offending against such regulations shall be subject to a fine not exceeding five thousand dollars ($5,000), to be recovered in any court of competent jurisdiction.

SEC. 12. That all laws and parts of laws conflicting with this act be, and are hereby, repealed.

Approved February 26, 1877.

AN ACT to amend an act entitled "An act to authorize the city council of Augusta to create a board of health for said city."

SECTION 1. *Be it enacted by the general assembly of the State of Georgia and it is hereby enacted by the authority of the same*, That from and after the passage of this act the words "a majority of the," in the ninth section of the above-recited act, be stricken out, and the word "five" inserted in lieu thereof.

SEC. 2. That all laws and parts of laws conflicting with this act be, and the same are hereby, repealed.

Approved August 23, 1879.

Extract from the city code of 1880, page 43.

CHAPTER XXXVI.

Board of health.

1. The following-named persons, and their successors, with the mayor and health committee of council for the time being, who are *ex-officio* members of said board, shall constitute a board of health for this city, viz: From the first ward, Samuel Levy, esq., for the space of four years, and until his successor is appointed; from the second ward, William F. Eve, esq., for the term of four years, and until his successor is appointed; from the third ward, Robert A. Fleming, esq., for the term of three years, and until his successor is appointed; from the fourth ward, William Mulherin, esq., for the term of four years, and until his successor is appointed; two physicians from the city at large, and a chemist, to serve for four years each, and until their successors are appointed; each of whom shall be nominated by the mayor of the city, to be approved of by council, and all of whom shall serve without pay or emolument; the term of office to be from the date of appointment.

2. The said board of health shall have full power to institute all sanitary measures necessary for the preservation of the public health of said city, and for the prevention of the generation and introduction of infectious and contagious diseases, yellow fever, small-pox, and cholera, and may exercise absolute power over the subject of quarantine, personal or otherwise, and, in general, shall be clothed with all the power, authority, and jurisdiction conferred by the creating act, and shall discharge the duties therein imposed, subject, however, to the restrictions and limitations therein prescribed, and especially subject to the authority and control of the city council of Augusta.

3. The recorder's court shall have jurisdiction to try all parties charged with violations of the ordinances and sanitary regulations of said board of health, and such parties, upon conviction, shall be punished by a fine not exceeding five hundred dollars, imprisonment in the county jail, or labor on the public works, either not to exceed three months; and for any violation of the quarantine regulations of said board, such penalty or penalties shall be inflicted as are provided in section 4310 of the code of Georgia, as provided by the act of the legislature of this State authorizing the creation of said board.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough sends reports to July 31. A few cases of cholera had occurred during the month among the native population, but the disease was not epidemic. No deaths among the foreign residents. Sanitary condition of the native city population not good, and drainage very defective. Population about 300,000.

ANTIGUA, WEST INDIES.—United States Consul C. E. Jackson forwards report of the registrar-general for the year 1879. There were 1,238 births and 1,165 deaths registered, the death-rate being 33.9 per 1,000. The infant mortality was 36.6 per cent. of the total. Of 158 deaths classed under "fevers," only 3 were from yellow fever. The proportion of illegitimate births for the whole island was 72 per cent. of the total, and in one parish nearly 81 per cent.; the high rate of infant mortality is partly due to this state of morals. There were 188 marriages recorded in the island during the year. The general health of the people is good, no yellow fever or epidemic disease prevailing.

BRUNSWICK, GERMANY.—United States Consul W. U. Fox reports that two cases of cholera, occurring early in September, caused some alarm, but investigation proved that they were not Asiatic cholera, and that there was no danger of the disease becoming epidemic.

CALCUTTA.—The report of the health officer, K. McLeod, M. D., for the second quarter of 1880 gives the number of deaths from several causes as follows: Fevers, 619; cholera, 129; diarrhœa and dysentery, 225; small-pox, 26; other causes, 1,454; total, 2,453. The births in the same period were 1,716.

CONSTANTINOPLE.—United States Consul H. G. Heap forwards reports of Dr. H. B. Matteosian from July 12 to August 29. Typhus fever is decreasing in all the provinces noted, but dysentery is more prevalent than usual in that of Van. About Gaza and Salonica and in Thessaly some disease was noted among cattle, and horses are reported diseased at Medina.

FOOCHOW, CHINA.—United States Consul J. C. Wingate sends reports for the month of July, stating that the sanitary condition of the foreign settlement is good, but that of the native city very bad, owing to defective drainage and accumulation of filth. The population of the city is estimated at 600,000, and of the suburbs at 500,000. No vital statistics can be obtained.

HAVANA, CUBA.—For the week ending September 10, 20 deaths from yellow fever are reported. During the last month the disease

has shown a tendency to increase and to spread to the shipping at the wharves, but most of the cases are mild. The vessels supposed to have had the fever on board, while discharging at infected wharves, were the Spanish bark *Arauco*, for Charleston, S. C., September 7, and the American bark *Shetland*, for Boston, September 11. During the week ending September 17, there were 19 deaths from yellow fever, of which 10 were in the city and 9 in the military hospitals. The type of the disease continues mild, and the proportion of deaths to cases is small. The following vessels, which have sailed or are about to sail for ports in the United States, are believed to have had yellow fever on board while at Havana: The Spanish barkentine *Clementina*, for Brunswick, Ga., September 16; American bark *Isaac Jackson*, for New York, *via* Caibanen, September 17; Spanish barks *Catalina*, *India*, and *Altagracia*, which will sail for Savannah September 18.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer forwards the official report for the month of June, from which it appears there were 823 births and 381 deaths during the month, in a population of 265,000, including the city and suburbs. The birth-rate was therefore 37.3 and the death-rate 17.3 per 1,000 per annum. Of the 381 deaths, 52 were from zymotic diseases, 43 from consumption, 93 from other lung diseases, 25 from diseases of the digestive system, 49 from those of the nervous system, 21 from heart diseases, and 16 from violence or accidents. There were 139 deaths under 5 years, being 36.5 per cent. of the total; of these deaths 93 were under 1 year of age. The deaths in child-birth were 3, or one to every 274 births registered.

NASSAU, WEST INDIES.—United States Vice-Consul S. P. Saunders makes the following observations upon yellow fever in the island of New Providence, under date of September 13:

I have to report that during the week ending August 14 there were 16 cases of yellow fever in this city, and 4 deaths; the week ending August 21, 33 cases and 3 deaths; the week ending August 28, 24 cases and 1 death; the week ending September 4, 5 cases and 2 deaths; and the week ending September 11, 1 case and no death. It will be noticed that although there have been 79 cases in the five weeks mentioned, only 10 of them have ended fatally.

At this period of the year the island has, heretofore, been regularly visited by a common bilious fever, but it is a noticeable fact that during the present year there has been almost an entire absence of this fever; it has either run into the more malignant type, or else several cases which have been reported as yellow fever have been nothing more than severe cases of bilious fever.

Judging by the very small proportion of deaths to the number of cases reported during the last five weeks (the regular bilious fever period), it is but natural to suppose that bilious fever has sometimes been mistaken for yellow fever, and that, therefore, the disease has been somewhat overrated.

Up to the 6th instant, the board of health, which is composed principally of the physicians of the island, had styled the disease, in their official returns to me, "Malignant and Hemorrhagic Fever," but at a meeting held on the 6th, it was decided to call the disease yellow fever in future. It appears that in the case of native children attacked, it has not always followed the usual and well-known course of yellow fever, and it was consequently thought by some physicians that there were two fevers of malignant type existing in the island at the same time, namely, yellow fever in the case of unacclimated adults, and a malarial hemorrhagic fever in the case of native children; and hence it was that they were both classed under one head as "Malignant and Hemorrhagic Fever."

I am happy to state that the disease appears to be rapidly dying out; last week only one case was reported, and up to the date of this dispatch there has been only one case for the current week.

NINGPO, CHINA.—The reports for three weeks ending July 31, forwarded by United States Consul E. C. Lord, represent that the health of the city is good, though the unusually cool and wet weather prevailing during the month has increased diarrhœal diseases and fevers to some extent. The range of mean temperature was from 82° to 85°.

NEW ZEALAND.—Reports for the month of June give 498 births and 147 deaths in a population of 130,225. In the four principal boroughs, having a population of 75,719, the deaths were 103, of which 34 were under 5 years, 15 were from zymotic diseases, 12 from consumption, 10 from other lung diseases, 13 from diseases of the brain and nervous system, 2 from diseases of the heart, and 2 from those of the digestive system.

SINGAPORE.—United States Consul A. G. Studer, under date of August 2, reports his district free from infectious or epidemic diseases.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic or contagious diseases up to August 9.

SYDNEY, AUSTRALIA.—During the month of June, 307 births and 200 deaths were recorded. Among the causes of death were, diseases of the brain and nervous system, 39; of the heart, 11; of the lungs, 21; consumption, 19; violent deaths, 7. In the suburbs, 402 births and 151 deaths were registered. The mortality under 5 years was 31 per cent. in the city, and in the suburbs 49 per cent. of the total. The temperature ranged from 40° to 68°; westerly winds prevailed, and rain fell on ten days, the total rain-fall being 5.2 inches.

The report for the quarter ending June 30 gives a total of 2,184 births and 1,000 deaths, in a population of 136,483.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

AUGUSTA, GA.—Dr. L. T. Blome, secretary of the board of health of Augusta, under date of September 13, states that there is a fever prevailing which is called "break-bone," or *dengue*, by some physicians, but is generally regarded as simple malarial fever with spinal irritation. The same disease is said to prevail in several other cities of the South Atlantic and Gulf States. The city authorities are disposed to co-operate with the board of health in improving the drainage and general sanitary condition of the city. Dr. Blome forwards a copy of the legislative acts, a portion of which will be found in another column.

BOULDER, COLO.—Dr. Charles Ambrook, under date of September 20, reports the passage of an ordinance relating to vital statistics, which is given in another column. Some typhoid fever has been noted of late, and Dr. Ambrook believes that this disease may be caused by a poison generated within the body of the patient under the best circumstances of drainage, food, and water supply, healthy locality, and absence of contagion. The disease thus originating may be intensified, and the poison may be communicated by infection or contagion to other persons, defective sanitary and hygienic conditions, of course, favoring such transmission.

EAST SAGINAW, MICH., September 26.—Dr. B. L. Cleveland, health officer, reports that diphtheria has prevailed for several months. Since May 1 there have been 71 cases and 13 deaths recorded. Burial permits are required, and the printed forms furnished to physicians specify the name, date of death, place of birth, age, occupation, and cause of death of each decedent.

HOUSTON, TEX.—Under date of September 20, Dr. W. L. Coleman states that for two months past there have been frequent rains, and malarial fevers have been unusually prevalent. In August they were of intermittent type, but during September the remittent and continued form is common. During three days of the first week in September a "Norther" prevailed, reducing the temperature to 54°. This was followed by a rapid increase in the number of cases of fever, and it is estimated that there are over 3,000 cases in Houston at present. The disease usually lasts from three to seven days, but after convalescence patients frequently suffer for some time with supra-orbital neuralgia, and headache, with pains in the back and stomach. In children, convulsions often occur. The tendency to hemorrhage from the mucous surfaces is marked. In several cases of malarial hæmaturia, full doses of ergot, quinine, and opium have been used with success. The general sanitary condition of the city is not good, and vigilance will be required to prevent the introduction of disease, such as yellow fever, from without.

KEY WEST, FLA.—A dispatch from the health officer, R. J. Perry, dated September 21, states that no yellow fever is known to exist at that port or in its vicinity. Some 30 or 40 cases of a mild form of *dengue* fever have occurred during the past two months among the native children.

NEW YORK QUARANTINE.—Dr. W. M. Smith, under date of September 20, states that the reports of yellow fever on board the bark *Erinagh* and other vessels are entirely groundless. The cases so reported were typho-malarial fevers, aggravated frequently by the foul and ill-ventilated condition of the forecastle of the vessels. These fevers have been found on vessels from Port de Paix and Pointe à Pitre, and are of malarial origin only.

SAINT MARY'S, GA., September 17.—Dr. A. F. Barnard reports that the town continues healthy. A few cases of measles have occurred; but the only death recorded for the three months ending September 13 was one from intussusception.

TARRYTOWN, N. Y.—Under date of September 27, Dr. N. H. Freeland, health officer, reports an epidemic of dysentery existing since the middle of August. The disease is confined to a population of laborers who have been employed in deepening the bed of a brook, for better drainage of the town. These people are ill-fed, and their water supply is from wells subject to pollution from surface drainage. Twenty cases and 4 deaths are reported.

MISSISSIPPI RIVER INSPECTION.

Under date of September 24, Dr. R. W. Mitchell, member of the National Board of Health, forwards the following application from Dr. W. T. Balfour, health officer at Vicksburg, Miss., which application has been granted:

At a meeting of the mayor and council of the city of Vicksburg, held at the city hall on September 20, I am instructed by a resolution of said mayor and council to request the continuance of the National Board of Health inspecting station below this city till October 15, 1880, as by such continuance this community would feel much more protected.

Hoping you will grant the above request and notify me of your action,

I remain, respectfully,

W. T. BALFOUR, M. D.,
Health Officer.

QUARANTINE NOTICE.

SAPELO QUARANTINE STATION.—Under date of September 15, Dr. W. H. Elliott forwards the following notice to pilots, issued by the authorities of Brunswick, Ga.:

QUARANTINE NOTICE.

Pilots will, in all cases, before boarding, make inquiry as to the sanitary condition of the vessels destined for this port. Vessels with cases of sickness on board, or on which serious cases have occurred, either during the voyage or in the port of departure, will be ordered to proceed at once to the national quarantine station at Sapelo.

All vessels bearing the certificate of the national quarantine officer, bound for this port, will be brought to anchor within the quarantine limits of this port until inspected by the health officer.

All other vessels destined for this port will be subject to the regulations previously issued.

JAS. S. BLAIN, M. D.,
Health Officer, C. B.

Brunswick, Ga., August 23, 1880.

SANITARY SURVEY OF PEARLINGTON, MISS.

Dr. J. A. Mead forwards the following report of a sanitary survey of the above place, with schedule of forms filled as required by the National Board of Health:

The printed form is filled, as far as it can apply to a small country place without any organized municipal form of government and a total absence of records.

The inspection was a house to house visit, and the endeavor was made to be thorough. The water supply was found to be in most cases anything but desirable, being derived from under-ground cisterns made in the most primitive manner, simply a hole in the ground lined with planks. A few cisterns are above ground. The occupants of the dwellings that were found in the worst sanitary condition were near the mills, and obtained their water from large cisterns above ground connected with the mills. The greater portion of the population reside in cabins well ventilated for the summer months, and too much ventilation for good health in winter. No provision is made for the removal of excreta and garbage; but, as nearly every dwelling has a small garden attached, a large portion is used to fertilize the earth. The privies are removed from fifty to one hundred and fifty feet from the dwellings, and are without vaults in nearly every case.

Among the tenant class the sanitary condition is bad; they are ignorant negroes, who pay but little attention to cleanliness of person or dwelling. They say: "We cannot clean up our places and work as we do from daylight to dark in the mills."

There is no regular system of drainage, but owing to the surface formation water does not remain in yards any length of time.

AURORA, ILL., September 24.—Dr. M. M. Robbins, president of the board of health, states that typho-malarial fever prevails in the city, most of the more severe cases being confined to one section.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Meridian, Miss., 4,013; deaths, 3; under 5 years, 1; diarrhœa 1. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; deaths, 2; under 5 years, 1; malarial fever 1. Monmouth, Ill., 6,000; deaths, 2; under 5 years, 1; croup 1. Mount Pleasant, Iowa, 4,500; deaths, 1; under 5 years, 1. Muscatine, Iowa, 8,412; deaths, 3; diarrhœa 1; accident 1. Muskegon, Mich., 11,300; deaths, 2; malarial fever 1. Niles, Mich., 4,200; no deaths. Okolona, Miss., 2,000; no deaths. Oshkosh, Wis., 17,030; deaths, 8; under 5 years, 3; consumption 1; diarrhœa 3; lung disease 2. Painesville, Ohio, 5,500; no deaths. Pass Christian, Miss., 4,000; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; no deaths. Pleasant Hill, Miss., 252. Port Royal, S. C., 750; deaths, 2; under 5 years, 1; consumption 1; croup 1. Rock Island, Ill., 12,000; deaths, 4; under 5 years, 4; diarrhœa 3. Santa Cruz, Cal., 5,000; no deaths. Springfield, Ohio, 21,000; deaths, 7; under 5 years, 3; consumption 1; diarrhœa 2; scarlet fever 1. Starkville, Miss., 1,450; deaths, 1; pneumonia 1. Steubenville, Ohio, 13,500; deaths, 1; under 5 years, 1. Summit, Miss., 1,808; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 2; under 5 years, 1; enteric fever 1. Tuskaloosa, Ala., 2,000; deaths, 2; under 5 years, 1; diphtheria 1; malarial fever 1. Winchester, Va., 5,000; deaths, 1; accident 1. Winona, Minn., 10,000; deaths, 1; consumption 1. Total population, 249,449; deaths under 5 years, 31; total deaths, 93; annual rate per 1,000, 16.8.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

Countries.	Places.	Population.	Week ending—	Total deaths.	Annual rate per 1,000.	Cholera.		Yellow fever.		Small pox.		Typhoid fever.		Typhus fever.		Other contagious diseases.		Weekly mean of thermometer.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, OCTOBER 9, 1880. [No. 15.

THE FEVER ON THE LOWER MISSISSIPPI.

NEW ORLEANS, *October* 4, 1880.

SIR: Definite information of the existence of a suspicious form of fever in Plaquemine Parish, La., on the Lower Mississippi, having been received by the member of the National Board of Health resident in New Orleans, George M. Sternberg, surgeon, U. S. A., was requested to visit the locality, examine such number of cases as might be necessary to enable him to determine the nature of the fever, and report the result of his investigation to the New Orleans member. Surgeon Sternberg was selected for this duty because of his extensive and intimate acquaintance with the fevers of the Gulf coast and Spanish Main; because of the recognized skill and ability which had led to his being chosen one of the experts on the Havana Yellow-Fever Commission, and to his being intrusted with the duty of preparing the article on yellow fever in the supplement to Ziemssen's Cyclopedia, and also because of his position as a United States Army medical officer, which, while it removed him on the one hand from the probability of having his judgment or conclusions influenced by local or personal considerations, on the other, devolved upon him the responsibility of representing an extremely sensitive professional body.

On the 10th of September, Dr. Sternberg made a detailed report, in which, after reciting the history of the sickness from the appearance of the first case, early in August, up to the date of his investigation, he positively asserted the existence of yellow fever of a mild type, with a low rate of mortality, except where the disease was aggravated by vicious local conditions. In the area where this prevailed, Dr. Sternberg also found a malarial fever, attributed by the local physicians to exposure in the rice harvest, and which they called rice fever.

Upon receipt of this report a telegram was sent to the executive committee asking that, if Dr. Sternberg's opinion was of sufficient weight, an appropriation of from five thousand to ten thousand dollars be made from the contingent fund and placed at the disposal of the Louisiana State board of health for use in the necessary preventive measures. The appropriation was immediately ordered, and a tender of the sum was made, as above indicated, on the 13th of September.

Recognizing only the existence of the so-called rice fever, the State board declined the offer of the National Board and claimed to have "instituted such measures as it deemed necessary." Up to this time the action of the Louisiana member, representing the National Board of Health, had been governed by that portion of sec. 3 of the act of June 2, 1879, which makes it the duty of the board to "co-operate with and, so far as it lawfully may, aid State and municipal boards of health in the execution and enforcement of the rules and regulations of such boards to prevent the introduction of contagious or infectious diseases into the United States from foreign countries, and into one State from another."

The rejection of this proffer to "co-operate and aid," however, now made it incumbent upon the National Board, through its representative, to take such steps as might determine whether the contingency was grave enough to warrant action under that clause in section 3 which directs the board to "report the facts to the President of the United States," whose duty it then is to use the Executive authority in executing and enforcing the necessary rules and regulations. With this object the member of the National Board of Health resident in Memphis was summoned to New Orleans, and, after careful consideration of all the facts, it was decided to send a commission of three medical gentlemen to the compromised locality, and to base the action of the board upon the report of said commission. These gentlemen (selected with the approval of the auxiliary sanitary association) were Dr. J. Dickson Bruns, of New Orleans, Dr. J. P. Davidson, of the Louisiana State board of health, and Surgeon Sternberg, U. S. A., and they were accompanied on their mission by the Tennessee member of the National Board, the Louisiana member being prevented by his only partial convalescence from a recent attack of the prevailing dengue.

Without entering upon any discussion of the two reports made, the one by Drs. Bruns and Davidson, and the other by Surgeon Sternberg, it is sufficient for the present purpose to say that it was made evident, as well by the conflicting reports of the commission as by the personal observation of the Tennessee member, that no practical benefit could now be attained from Executive interference.

Whatever danger had threatened the public health of the Mississippi Valley had either passed away—the disease having run its course—or it had been so widely scattered that preventive measures on any adequate scale were impracticable for the time being.

Considering the advanced stage of the season, the favorable health conditions of the valley, the more than doubtful utility of any steps still possible looking to isolation, disinfection, &c., and the desirability of avoiding overt action likely to create anxiety and apprehension, if not positive panic—these considerations have induced the representatives of the board to refrain from recommending further action in the premises at the present time.

They cannot, however, close this report without placing themselves on record as fully accepting and indorsing Surgeon Sternberg's conclusions, to wit:

1. That yellow fever (about 100 cases) existed between August 1 and September 10 in Plaquemine Parish, Louisiana.

2. That the outbreak had its origin in the immediate vicinity of the Mississippi River quarantine station, the first case, August 1, occurring directly opposite the point where the infected bark Excelsior was detained from July 11 to August 16.

3. That while the type of the disease was generally mild, vicious local conditions existed which aggravated it into the most fatal form, four dying in one family out of five attacked.

The details of the investigations upon which these conclusions are based will be found in the accompanying reports of Surgeon Sternberg.

All of which is respectfully submitted,

S. M. BEMISS,
Member National Board of Health, New Orleans, La.
R. W. MITCHELL,
Member National Board of Health, Memphis, Tenn.

To the SECRETARY OF THE NATIONAL BOARD OF HEALTH,
Washington, D. C.

[Copy of letter sent to Joseph Jones, M. D., President Louisiana State Board of Health.]

NEW ORLEANS, LA., *September* 13, 1880.

SIR: I respectfully call your attention to the accompanying report from Dr. G. M. Sternberg, regarding the disease at this time prevailing on the lower coast of the Mississippi River. In my opinion, the symptoms and mode of spread bear so close a resemblance to yellow fever that no time should be lost in applying all possible means to prevent its further spread. With a view to the accomplishment of this end, I have to inform you that you are authorized to draw upon the National Board of Health for such sums of money as may be necessary to procure disinfectants and to pay for the services of sanitary police, and sanitary inspectors, and in truth all expenses expedient to the purposes mentioned. This money cannot be drawn from the Treasury except in payment of bills for services or articles, which bills must be duly authenticated. You will therefore make requisitions from time to time for such service, disinfectants, &c., as are in your opinion required, and forward same to me. This appropriation will apply to cases of infectious disease in this city, and in all places within the limits of the State which have no local boards to exercise such powers. The organization of the work will rest with yourself, subject to the approval of the National Board. You will therefore in all cases forward me the names of persons recommended to be employed, with pay of each, and each one must take an oath of office, and have his name carefully entered upon blank pay-rolls which will be furnished you, and then no trouble will occur in regard to payments. It is well to remark that the Treasury Department refuses to pay for goods or clothing destroyed to prevent spread of disease, but will pay any reasonable expenses for cleaning and disinfectants.

S. M. BEMISS.

DR. JOSEPH JONES,
President Louisiana State Board of Health.

Dr. S. M. Bemiss, of New Orleans, member of the National Board of Health, writes under date of September 8 that he has instructed Dr. G. M. Sternberg, of the United States Army, to investigate and report upon the character of a fever prevailing on the lower coast of the Mississippi, and especially in the vicinity of Point a la Hache.

The report of Dr. Sternberg and that of Drs. Bruns and Davidson are given below:

[Copy of report by Dr. George Sternberg, U. S. A.]

NEW ORLEANS, *September* 10, 1880.

SIR: I have the honor to report that, in compliance with your request, I have visited Point Michel and Pointe à la Hache, for the purpose of ascertaining the nature of the sickness prevailing there. Dr. Hays, in whose practice most of the cases have occurred, aided me in every manner possible, and in his company and that of Dr. Taylor, who represents the State board of health, I visited about twenty cases of the prevailing fever. Many of Dr. Hays' patients are convalescent, but in the practice of Dr. Heber, on the opposite side of the river, I found three recent cases in one house and three in another distant five miles from the first. In one of these houses we also found the dead body of Andrew Dragon, a light mulatto, aged 17, who died about two hours before our arrival. Dr. Hays has had in his practice 61 cases, and Dr. Heber, so far as I could learn, 7 cases of the prevailing fever. The first case occurred August 15th, in the practice of Dr. Hays, on the right bank of the river, seven miles below his house.

The following day a case occurred two miles above the first. On the 20th (August) another case occurred in the vicinity of the first, and 1 within two miles of Dr. Hays' house. On the 22d, 2 cases; on the 23d, 2 cases, and on the 24th 2 cases were taken sick in the neighborhood of the first case; on the 24th 3 cases also occurred in a locality one and one-quarter mile above the doctor's house. This was followed by 3 on the 25th and 3 on the 26th in the same locality. Dr. Hays was also called to see a case on the opposite side of the river, four miles below his house, on the 23d. In the locality one and one-fourth mile above Dr. Hays' house four children have died in the family of —— Girdean. The two remaining children in the family had been seriously sick, but at the time of my visit appeared to be convalescent. A young man named Littel, aged 19, also died in this vicinity, making 6 deaths in all, on both sides of the river, in a total of 68 cases. It is not my intention at present to study this local epidemic from an etiological point of view. I desire simply to state the facts as I was able to glean, in a single day, which have a bearing upon the question of diagnosis. While abundant rains fell during the month of August above and below this vicinity, I am informed that for a month, until quite recently, there was no rain in this immediate neighborhood; also, that a disagreeable odor was observed to come from the *batture* along the river bank. Rice is cultivated extensively in the vicinity, and one or two of the cases were taken sick while at work in the rice fields. I would observe here, however, that nearly all of the cases are young children, and that the adults who, by reason of their exposure in the rice fields, would be most subject to malarial poisoning, have to a great extent escaped. The cases have mostly been children of French creoles—light mulattoes—who constitute the greater portion of the population in this vicinity. I inquired as to whether any of the cases had previously suffered from yellow fever, but could not get any very definite information. A similar fever prevailed in 1878, which some physicians called yellow fever, but Dr. Hays believes it also to have been malarial fever. The area in which this fever prevailed, on the right bank of the river, was somewhat different from that in which most of the cases have occurred this year. The fever of 1878 did not extend below a certain point, while the fever of this year has been mostly below this line. As to the nature of the disease, it is a continued fever of a single paroxysm, lasting, it is said, from a few hours to four or five days. No regular temperature observations have been made, but from the statements of Dr. Hays, and my own observations, I am satisfied that the fever is of a mild grade, and not characterized by remissions or intermissions. The highest temperature observed by me was 103° (second day of disease). At the outset of the attack the eyes are glistening, pupils more or less dilated, gums bright red and swollen, tongue slightly or heavily coated with a white fur, in some cases almost clean, and in one dry and brownish. The skin is usually moist and perspiring. In two cases I noticed that the excitement caused by our presence caused the perspiration to cease and the skin to become dry. Pulse rather soft and not very frequent (in two cases, second day, in which I counted it was 100). Slight pain in head and loins, at commencement of attack. Afterwards no pain was complained of, except occasionally some epigastric distress. There was bilious vomiting at the outset in some of these cases. In others no vomiting occurred. In only one of the fatal cases (child of Girdean) was there a suspicion of coffee-ground vomit. One or two had nose-bleed at the commencement of the attack. No other hemorrhages are reported. Dr. Hays had not discovered any albumen in the urine of his fatal cases. In Dr. Heber's fatal case the urine was highly albuminous, and suppression occurred 16 hours before death. The depending portions of the body of this young man presented a mottled appearance two hours after death. His natural color was light yellow. I did not discover any decided yellowness of the conjunctivæ in any case. Yellowness of the skin I could hardly have distinguished, on account of the complexion of the patient. I found albumen in three cases. Other cases in which no albumen was found were too far advanced in convalescence or too early in the disease to make the absence of albumen a point of diagnostic importance. In one case, in which the most abundant deposit of albumen occurred—a boy of 12—the boy was dressed and sitting up. He had slight fever, glistening eyes, red spongy gums, and slight headache. Finally, as to the diagnosis, I believe these cases to correspond with what is known in the Antilles and tropical America as *fièvre inflammatoire, fièvre d'acclimation, fièvre jaune bénigne, fièvre jaune abortive, fièvre jaune des Créoles, dengue*, etc. Bérenger-Feraud says of these fevers, "These fevers may exist sporadically, like the yellow fever, and also epidemically, *but it is above all at the approach or decline of the epidemics of yellow fever that they are observed in the greatest number.* They present different forms; the most frequent form is observed among peoples *who are subject to be attacked by yellow fever.* It offers all the symptomatic appearances of the first degree of yellow fever, coloration of the skin and eyes, elevation of temperature and pulse, cephalalgia, rachialgia, contusion pains in the limbs. But whatever may be the intensity of these symptoms they all disappear at the end of 24 or 48 hours, and recovery takes place." In 1875 Bérenger-Feraud lost but three cases in 400, and in 1876 one case in 240. Such is the resemblance of this form of fever with the first degree of yellow fever that when it is observed sporadically without an epidemic of yellow fever the doctors of the country say, "If we were in the time of yellow fever we would say that it is yellow fever." Bérenger-Feraud claims that this fever prevails everywhere that yellow fever reigns, and says "It is a disease very near if not identical with yellow fever—an incomplete yellow fever." For me this fever is identical with yellow fever, and only differs in degree from the more severe forms which, because of the fatality which attends them, are known and dreaded by all. It seems to me extremely unscientific to make our diagnosis depend upon a greater or less percentage of mortality, and the sooner physicians in the yellow-fever zone admit, what I believe to be true, that yellow fever is not always a malignant disease, and that the immunity of creoles is due to their having suffered (generally in childhood) from this milder form of the disease which has received so many different names, and that it is not a birthright, the better will it be for the progress of medical science and the true interests of the countries where these diseases prevail.

Dr. S. M. BEMISS,
Member National Board of Health.

SECOND REPORT OF DR. GEORGE M. STERNBERG, U. S. A., MEMBER OF COMMISSION VISITING POINTE À LA HACHE AND VICINITY.

I regret to say that I can find no good reason for changing the opinion, given after my first visit to Point Michel, as to the nature of the fever prevailing in that vicinity. I have not seen during either visit any case which, *alone*, would enable me to make a positive diagnosis of yellow fever, but from a consideration of all the cases seen by me during my two visits, and of the facts relating to the origin and progress of the epidemic, cannot doubt that this fever is the mild type of yellow fever which has been described under various synonyms given in my previous report, and which Blair more properly calls "yellow fever *simplex*" to distinguish it from the more malignant type called by him "*gravior*." The main facts upon which I base this opinion are the following: The first cases, so far as I can learn, occurred in the practice of Dr. Westerfield directly opposite the quarantine station, about the 1st of August. It will be remembered that the infected bark Excelsior was anchored at this point for eleven days, from June 24 to July 5. No cases occurred in Dr. Westerfield's practice for four or five days after the first case, when six cases occurred in one family, 1½ miles below, then seven cases in another family about the middle of August. It was about this time (August 15) that Dr. Hays saw his first case, 7 miles down the river from his house. This locality subsequently furnished a considerable number of cases (at least 15). Later (August 24), an infected locality was developed 1½ miles above Dr. Hays's house; up to this time no deaths had occurred, but in this locality four children died in one family, and a young man in the immediate neighborhood still later. September 4, the fatal case of Adrian Dragon and other mild cases in the same family occurred in the practice of Dr. Hébert, on the east bank of the river, and several miles farther up stream. In the practice of Dr. Wilkinson, on the west bank of the river, and just above Dr. Hays's, no cases of the same fever have occurred. Dr. Westerfield says that his cases occurred mostly where there is a batture on the river front; where there was no batture he had no cases. He says the disease has taken the same course as in 1878. He does not recollect that one of the cases of this year had fever in 1878. The majority were French children. Has had some severe cases with great irritability of stomach, but no deaths. Did not examine the urine or make temperature observations. The theory that this fever results from malarial emanations from rice fields seems to me untenable from the history of this epidemic, as above given, from the fact that adults are most exposed to these emanations, while children are most subject to this fever, and that in various localities where rice is cultivated, as in Dr. Wilkinson's practice, this fever has not prevailed. I am informed that a similar fever does prevail at Port Eads where there are no rice fields. There is, however, in this vicinity a pilot's village and a custom-house station, so that it is presumable that communication with infected vessels occurs before these vessels are subjected to disinfection, &c. I am also informed that communication between this point and the city of New Orleans

is unrestricted. At the quarantine station I find a little settlement of two or three houses within a few hundred yards of the wharf, over which the quarantine physician has no control. The facilities for intercourse with infected vessels are certainly not insurmountable, and I find, moreover, that river packets which touch all along the banks of the river on their way up and down from New Orleans are in the habit of tying up for the night at the quarantine wharf. There is, therefore, no difficulty in accounting for the introduction and dissemination of a disease such as I suppose this to be, and from my point of view the battures along the river bank furnish favorable local conditions for the increase of the specific poison of the disease during the summer months. As to the clinical history I have no reason to believe that all the cases of fever on the river banks have been of the same nature. Drs. Wilkinson, Hébert, and Hays all state that cases of intermittent fever constantly occur in their practice, and doubtless autumnal remittents prevail to some extent. Temperature observations have only been made in a few cases, but the history given me by Dr. Hays and Dr. Hébert of the cases which I have seen, is of a continued fever of a single paroxysm, lasting from twenty-four hours to four or five days. I have obtained an incomplete record of temperature in two cases only. Tommy Gilmore, aged 10, was taken sick at *midnight* Sunday (September 12); no chill; temperature 106°; Monday morning temperature 105°, evening 104°.5; Tuesday morning, 104°; Wednesday 3 p. m., 103°; Thursday morning, 101°.6. I was unable to obtain a specimen of urine for examination in this case. Michael Halenin, aged 25 (?), says he had yellow fever in 1867, taken sick at 10 a. m., Sunday (September 12); temperature Sunday noon, 103°; Monday morning 101°.2+, evening 102°.2+; Wednesday morning, 101°. Has albuminous urine, highly acid, and containing granular tube casts. In one case, in the practice of Dr. Jones, a relapse occurred from exposure before complete convalescence was established. We found this patient, a boy of 12, very much prostrated, and having highly albuminous urine of acid reaction, containing granular tube casts. This is the fifth case in which I have found albumen in the urine, and that in a fever which is chiefly characterized by the mildness of its course and the absence of distressing symptoms—a very different fever, in my view, from the high grade of malarial fever, with a tendency to local congestion and hemorrhages, which occasionally presents the phenomenon of albuminous urine. In one case, in the stages of calm the patient had a pulse of 60 beats in the minute. I should say, from my observations, that this fever is characterized by rather a slow (after the first day) and soft pulse, a perspiring skin, a clear intellect, and an irritable stomach. I did not observe yellowness of the skin or conjunctivæ in any case; but do not look upon this symptom as a common characteristic of the milder form of yellow fever. My experience in regard to this point corresponds with that of Blair, who says: "It certainly must be admitted that a large proportion of the cases of yellow fever are unattended by yellowness of the surface or even of the eye, for the disease may be cut short by treatment (?), or the epidemic may be of the simplex grade, or the mitior and the yellow suffusion may be so slight as to escape notice." The total number of cases has been about 100, exclusive of those occurring in the practice of Dr. Westerfield, whose figures I did not obtain.

The temperature chart in the case of Dr. Wilkinson, jr., as given by Dr. Finney, certainly justifies a diagnosis of remittent fever; but, as already stated, the history given by Drs. Hays and Dr. Hébert, both upon my first and second visit, was of a continued fever. Dr. Wilkinson, sr., the most experienced practitioner in the vicinity, who has been called to see many of the severe cases, in consultation, made an unqualified diagnosis of yellow fever. He is perfectly familiar with malarial fevers of the country, and has seen much of yellow fever; has had cases of malarial fever in his practice this fall, but considers the severe cases of continued fever which he has seen in the practice of Drs. Hébert and Hays as undoubted cases of yellow fever. Dr. Hébert evidently is much inclined to agree with Dr. Wilkersen. Dr. Hays insists that the disease is a malarial fever *of the same type as he saw in* 1878, which some practitioners in the vicinity called at the time yellow fever, but which he has never admitted to to have been yellow fever.

Respectfully submitted.

GEO. M. STERNBERG,
Surgeon, U. S. A.

THE RICE FEVER.

Reports of Doctors Bruns and Davidson on the fever which prevailed in Plaquemines Parish.

No. 142 Canal Street, New Orleans,
September 18, 1880.

Dear Sir: In obedience to your request of the 14th of September, that I should "proceed to the lower coast of the Mississippi River to inspect and report in regard to the prevalence of any infectious or other forms of fever prevailing in that section of the State," I have the honor to report that, on the morning of the 15th, at 8 a. m., the committee, consisting of Dr. J. P. Davidson, of the State board of health; Dr. G. M. Sternberg, surgeon United States Army, and myself, with Dr. Mitchel, of the National Board, who kindly accompanied us, and my son, Mr. H. D. Bruns, who volunteered to make the necessary autopsies, if opportunity offered, proceeded on the steamtug Aspinwall directly to Myrtle Grove, the plantation of Dr. J. B. Wilkinson, the oldest and most experienced physician in the parish of Plaquemines. We there learned that the doctor had been called to visit a case of fever on the left bank of the river, seven miles below, in consultation with the resident physician, Dr. N. M. Hebert. We reached the place designated, five miles above Pointe-a-la-Hache, too late to meet Dr. Wilkinson, but had the good fortune to encounter Dr. Hebert, who, with great courtesy, at once invited us to see his patient, a typical case, as he regarded it, of the prevailing fever. The following was his account of the case:

Paul Gravolet, white, male, aged 22 years, had sat up for two nights with Adrian Dragon, sick of the fever, and had afterwards attended his funeral. It was the body of this A. Dragon which Dr. Sternberg had seen on his previous visit to the parish and noticed in his report. A short while after, on the afternoon of the 10th, Gravolet was taken with a chill, followed by a violent headache, pain in the loins and legs, nausea, retching, and fever. Dr. Hebert visited him for the first time on the 12th instant at 8 a. m., and found him suffering from fever, with a hot, dry skin; temperature not noted. The vomiting of bile and mucus continued; the eyes were congested; the tongue moist, streaked in center, red at tip and edges, and was covered with a white fur; the fur had disappeared on the fourth day, leaving the whole organ red; the gums were red and swollen, but firm; there was much restlessness throughout the attack; the respiration was tranquil, without sighing; he complained of slight pain or pressure over epigastrium; the urine had been abundant, and free from albumen; there had been no delirium; comp. cath. pills, followed on Monday by calc., magnes., had acted freely, and quinine, in 4-gr. doses, until 52 grains were taken—in 48 hours—had been ordered, after the action of the magnesia. The doctor could not say that he had noticed any decided remission at the period of his visits, morning and evening, but had sometimes found him perspiring. He had broken his thermometer and could not tell what the diurnal variations of temperature may have been.

At the time of our visit, 1.30 p. m., September 15, the pulse was 80 to the minute, temperature 101 ½° Fahrenheit, respiration normal, tongue clean, gums pink and firm, skin pleasantly warm and soft, presenting no harshness nor pungency to the touch; the face was flushed, without capillary congestion; the body was of the natural color, and neither it nor the eyes showed the least tinge of yellowness; the *facies* was perfectly calm and the patient cheerful. He complained of some pain or pressure over stomach and abdomen. At 11 a. m. he had passed a small quantity of bright, florid blood by stool. The urine was abundant. A fresh specimen, tested on the spot, yielded, on the addition of nitric acid, a light precipitate, which cleared up perfectly on boiling. At our second visit, a little after noon the following day, we found him still convalescing. He had passed a little bright blood by stool during the night, but had slept well. The pulse was 60 to the minute, temperature 99 ⅘° Fahrenheit. No albumen in urine.

In the same neighborhood we saw, with Dr. Hebert, Pierre Dragon, white, male, aged 5 years, the younger brother of the above-mentioned Adrian. Three days before our visit he had recovered from an attack of fever; but two days after convalescence had partaken freely of sardines and chicken for breakfast, and at noon was seized with violent vomiting and purging. There had been no hemorrhage from bowels. The child was calm and cheerful; the skin soft and moist; the temperature carefully taken in axilla was 100° Fahrenheit. The pulse of the little patient, much excited by our presence, was by first count 110 to the minute. At the close of our somewhat protracted visit, it had fallen to 92. There had been six cases of fever in this family. All had recovered but Adrian. A small specimen of the patient's urine, very dirty, full of hairs and mucus, was secured. It threw down a flaky deposit on the addition of nitric acid, not cleared by boiling. As a substitute for filtering paper a single thickness of newspaper was tried. I thought it a clear case of failure, but if trustworthy the urine contained a trace of albumen. At our visit in the afternoon of the following day, the patient was convalescent, though still somewhat feverish.

Another patient of Dr. Hebert's visited by us in this neighborhood was Eliza Martin, white, female, aged fourteen years. She had come from New Orleans on the afternoon of the 10th, and was taken with fever three days after. She had been treated with calomel and quinine. On the second day of her fever (Tuesday) Dr. Hebert reports a well marked-remission in the morning. When seen by us on Wednesday at 3 p. m. her pulse was 120 to the minute, temperature 103⅘° Fahrenheit; the tongue soft, moist, marked by the teeth, covered with light white fur; the gums pale, pink, firm; *facies* calm; skin pleasant to touch and believed with slight perspiration. There was a tendency to diarrhœa, and slight pain was complained of on pressure over abdomen. Urine, tested on the spot with nitric acid and heat, was free from albumen.

On the opposite side of the river, at the Franklin Rice Mill, we also visited, with Dr. Hebert, a patient of Dr. Hays's, Michael Halceran, a native of Louisiana, white, male, married, aged 33 years. He had been taken on the 12th at 10 a. m., with chill, violent headache and pain in back and legs, accompanied by gastric distress and vomiting. The last continued throughout his attack; but we learned from his friends, and from his physican later, that this gastric irrita-

bility characterized him even in health. He is a confirmed dyspeptic, vomits his food frequently, and is unable to retain a dose of medicine, unless it be disguised and concealed even from his suspicion. Dr. Hays informed us the next day that when he first saw Halceran, at 12 m. on Sunday—two hours after his seizure—the temperature was 103° Fahrenheit. Of his temperature Monday he had no record, and did not recall it; but on Tuesday he found it to be 101¾° Fahrenheit, at his morning visit, and 102½ Fahrenheit in the afternoon. He was said to have had yellow fever during the epidemic of 1867.

At the time of our visit, we found him perfectly free of fever. He conversed cheerfully and readily, and his whole appearance was indicative of rapid and fine convalescence. The temperature was 100 Fahrenheit, pulse 62 to the minute, full, soft, slow; tongue clean and moist; no yellowness of conjunctiva or skin. Auscultation of heart revealed a soft, aortic, systolic murmur. Further inquiry, afterwards confirmed by Dr. Hays, revealed the fact that the patient had suffered from more than one attack of acute rheumatic fever. The urine showed a small quantity of albumen, probably persistent.

In an adjacent town I saw Mrs. Halceran, wife of above, well advanced in convalescence from a similar attack of fever, lasting only forty-eight hours. She complained of feeling a little weak; but had a good appetite, which she had been indulging for some days freely and without harm. Though we touched at this point the following day, we did not think it worth while to visit these patients again.

Moving down the right bank of the river we stopped at Dr. George B. Hays's residence, Point Michel, and were immediately joined by the doctor, who came on board the tug, and took us to visit some of the more interesting cases of his own, then under treatment. The great majority of the patients he has had were well or convalescent.

William Gilmore, white, male, aged nine years, was taken at midnight Sunday with the usual light chill and pains in back and legs. Dr. Hays, at the date of his first visit, about noon on Monday, found him with high fever, hot, dry skin, frequent, quick pulse, white furred tongue, and free from nausea, or pain at epigastrium; the respiration was slightly hurried, without sighing, and there was no jactitation. His temperature was 106° Fahrenheit. The following forenoon it was 105° Fahrenheit; in the afternoon 101½° Fahrenheit. On Wednesday morning it was 104½ Fahrenheit. At the time of our visit, 5.20 p. m., it was 103° Fahrenheit. Although an unusually nervous child and ministered to by a still more nervous mother, who hastened to inform him that the visit of so many doctors did not necessarily portend immediate dissolution, his expression was placid, exhibiting neither alarm nor depression. The conjunctivæ were pinkish; but there was no intolerance of light, nor pain on pressure over the eyeballs. The face was slightly flushed without capillary congestion. The color of the body was natural, and there was no yellowness of skin or eyes. To the touch the surface was dry and warm, without harshness or pungency. The pulse was 100 to the minute; respiration normal, no suspiria. The bowels had been freely moved, the dejections were natural, the urine copious. There was slight uneasiness manifested on pressure over epigastrium, and headache; but he made no complaint except of slight headache.

The following day we visited him again at 10 a. m. He had slept well; had two rather thin stools during night, the last at 4 a. m.; with both had passed urine freely. The pulse was 92; temperature 101⅗° Fahrenheit. *Facies* cheerful, skin pleasant. From the excessive nervousness of the little patient, we could not secure a specimen of urine for examination at either visit.

In this locality we also visited, with Dr. Hays, Millaudon Potoon, black, male, aged fourteen years, who was said to have had a relapse, succeeding a fever of four days' duration. We saw him again the following morning. At neither visit did he have any fever. The skin was rather cool, temperature normal, pulse soft and very compressible, but not frequent. The appetite was feeble, strength much exhausted, mind spiritless and dejected. He answered questions willingly, but slowly, and without animation. The decubitus was lateral, with the legs semiflexed, and we found him lying in exactly the same position, with the same air of utter indifference, on our second visit as we had left him on our first. He made no complaint, and on repeated inquiry admitted no special discomfort. His mother told us that he had been at work in the fields up to the date of his first attack; but the very great emaciation he exhibited was certainly not attributable to the brief acute attack he had experienced. He looked to me to be like a well-advanced case of tuberculosis, and on inquiry I learned from Dr. Hays that his father had died of phthisis pulmonalis. Dr. Hays had never examined his chest, and his condition and surroundings were such as not to invite my personal auscultation of him. A specimen of his urine exhibited, on the usual tests, an abundance of albumen.

In the same room lay a younger brother of Millaudon, convalescent from a mild attack of the fever.

At the quarantine station, which we reached at 9 p. m., we found to our regret the assistant quarantine physician, Dr. C. P. Wilkinson, down with the fever. He had been taken with the usual symptoms of chill, headache, pain in the back and legs, at 6 a. m. on Sunday, the twelfth, and when visited by us on Wednesday at 10 p. m. was, therefore, within 8 hours of completing his fourth day. The quarantine physician, Dr. Finney, had kept an accurate record of his temperature—the sole instance in which we had the fortune to obtain it—from which it appeared that, on seizure, his temperature was 100½° Fahrenheit. At noon the same day it was 103, and the same in the evening.

	Temp. Fahr.
Monday morning	101
Monday afternoon	104
Tuesday morning	101
Tuesday afternoon	104
Wednesday morning	101
Wednesday afternoon	104
And at 10 p. m., as taken by myself	103

He had, when we saw him, a hot skin; broad, moist tongue, covered with white fur; pulse 90, full, soft, regular; no precordial nor abdominal distress nor vomiting throughout the attack. He had taken quinine in ten-grain doses three times on day of attack, but owing to the irritation it excited, had at first moderated and then discontinued its use. Wednesday he had taken two three-grain doses. He talked to us with unusual animation and energy that night, and the following morning when we visited him, a little after daybreak, we found him perfectly free from fever, in high spirits, and only anxious to resume as soon as possible the duties which he has performed with so much zeal, fidelity, and intelligence.

Dr. Wilkinson is a native of Louisiana, aged 30 years. He stated that he had had an attack of yellow fever, in common with other members of his family, in 1855.

At an early hour the following morning, September 16, we crossed the river to Buras's post-office, which lies immediately opposite the quarantine station. There we had the pleasure of meeting with Dr. Westerfield, whose practice extends for many miles above and below that point. The sum of the information gathered from him was to the effect that the fever had prevailed very extensively in that neighborhood—principally above—which he attributed to the batture, there being a caving bank, washed by the river below. The fever had made its first appearance early in August, and about ten days thereafter had spread through the entire settlement, as many as five, six, and seven cases occurring in single families, and in some of these death by yellow fever had happened in 1878. The majority of his cases had been among white children. Negroes enjoyed, seemingly, more immunity, and females still greater. The average duration of the fever was about 48 hours, he thought. It yielded readily to quinine; fevers chiefly of the remittent type, though he had seen a few intermittents. There had been no death in his practice, nor had he seen a single case in which there was jaundice, black vomit, or suppression of urine.

Dr. Jones, whose area of observation and practice lies on the same bank of the river, between that of Dr. Westerfield and that of Dr. Hays, and with whom we passed some time later in the day, had treated about thirteen cases in all. There was, he thought, a well-marked remission in every case he had seen, but he had made no thermometric observations. The exacerbation took place toward night. The fever yielded readily to quinine, which he gave freely. The only difficulties he had experienced in the management of his cases arose from the tendency to undue cerebral excitement in children. He had lost none, nor had he seen any case with jaundice, black vomit, or suppression of urine.

Dr. Ryan told Dr. Davidson that at Pilot Town the same fever had prevailed extensively. He regarded it as a malarial fever, remittent in type. It yielded readily to quinine. He had no death in his practice, nor had any of his cases been attended with yellowness of skin or eyes, or black vomit, or suppression of urine.

Visiting, with Drs. Hays, Hebert, and Jones, who joined us, such cases of special interest as we had seen on the previous day, we reached Myrtle Grove about 2 p. m., and after an interesting conversation with Dr. J. B. Wilkinson—who, with two of his sons, paid us a visit on the tug—steamed directly for the city, which we reached at 6 p. m. on Thursday evening.

Through your own forethought and Dr. Mitchell's attentions we enjoyed every comfort possible on such a trip, and I take this opportunity, on the part of the whole commission, to express their deep sense of the courtesy they received from all the medical practitioners of the coast, who, with equal candor and cordiality at much self-sacrifice, devoted a large part of two days to showing us every case of interest in their practice and giving us all the information that could possibly throw any light on the object of our mission.

From personal observation, and from the information gathered on the spot, I have no hesitation in expressing, with the utmost confidence, the conviction that the disease now and lately prevailing on the lower coast is an endemic malarial fever of remittent type, and for the most part of a mild character. Its unusual prevalence is due partly to the meteorological conditions of the past summer, and partly, I believe, to the widely increased cultivation of rice. The alarm it temporarily excited was owing to its fatal results in a single family at the outset. Beyond this isolated instance it has been attended with the slightest mortality, and but for that it would have scarcely excited comment except as to its prevalence and diffusion. The diagnosis obviously lies between malarial and yellow fever, and the reasons for assigning it to the former class seem to me patent and indisputable.

In the first place, all the practitioners in the infected district

agree in the opinion, unqualifiedly expressed, that the disease is remittent fever, such as they are accustomed to treat every summer. The laity seem generally to share their views, giving the fever the trivial names, indifferently, of *la fievre du pays* or *la fievre paludicune*. Its ready amenability to quinine is, in itself, a strong proof of its miasmatic nature. If accurate records had been kept they would have been of prime assistance in arriving at certain conclusions; but, owing to loss or breakage of instruments, Dr. Hays was the only physician we met possessed of a thermometer, and the infrequency of his visits, from the great number of patients and the distances to be traveled, lessened the value of his observations as a clinical aid to diagnosis. Nor was it possible, from the most painstaking inquiry, to extract any supplemental information from the attendants or families of the sick. For the most part untrained, ignorant, careless, incapable, alike of observing or describing the most familiar phenomena, the utmost that could be hoped from them as nurses would be to give a dose of medicine at prescribed hours. Under these circumstances the general impression of the medical attendant as to the continued or interrupted course of the fever is the only evidence that can be had, and this, as I have stated, was uniformly to the effect that in all the cases diurnal remissions occurred, usually in the morning, judging from lowered pulses, diminished heat of skin, moisture, &c.

In theory and in text-books a remission is a well-defined, notable abatement, at calculable intervals, of all the more prominent symptoms of the fever, lasting for many hours. But at the bedside, especially in our graver forms of autumnal fevers, a remission is too frequently an obscure, imperfect, and ill-defined pause, as it were, between two prolonged exacerbations, filling up almost twice the entire round of twenty-four hours. The temporarily lowered pulse swiftly resumes its force and frequency; the moisture, slight and transient, extending only over the forehead, face and neck, quickly dries up, and the accurate and continued observation which marks the brief return of the same phenomena at the same hour of the succeeding day can alone truly interpret its quality and meaning.

With their imperfect opportunities and means of detecting such remissions it is scarcely to be wondered at that the physicians had no charts to exhibit. But Dr. Wilkinson was suffering when we saw him from the same type of fever that we had seen in him all day, and in his case the record kept by Dr. Finney supplies the missing link. It shows an access of fever, lasting all Sunday, with a well-marked remission in the morning and exacerbation in the evening of the following day, and the exact repetition of this rise and fall of temperature on two successive days thereafter, terminating at the end of the fourth day in a complete apyrexia.

Had a similar record been kept in all the cases, I do not doubt that it would have equally exhibited their remitting character, though doubtless in many of them the remissions may not have been so strongly marked.

So much concerning the type. Of the nature of the fever, without multiplying details, I will simply say that neither in its special features nor in their entirety could I realize a single prominent characteristic of yellow fever.

The broad, white, lightly furred tongue, moist in all stages, lacking the dry brown center or fiery tip and edges; the firm gums, free from sordes or oozing, or the clear or only lightly suffused eye, not smoky or brilliant or dull, with no tinge of yellowness; the warm, pleasant skin, neither bathed in hot sweat, nor harsh, nor pungent to the touch, nor bronzed nor jaundiced nor exhibiting capilliary congestion; the universal freedom from jactitation and delirium: the normal respiration, neither hurried, nor labored, nor sighing; the *facies*, free alike from terror or depression, calm, cheerful, smiling; the notable absence of any stage of calm intervening between a primary or secondary fever or of black vomit, or tarry dejections, or suppression of the urine, or sudden cardiac syncope, render it as certain as clinical observation can that the fever is not yellow fever.

And if we except the Giordano family, the extremely light mortality is no new important factor in the conclusion. Dr. Hays attributes the death of these four children of one household to their intractableness and refusal to take medicine. Now, in the graver forms of malarial fever the early and free administration of quinine often offers the sole means of saving life; but I cannot help thinking that, in this instance, there coexisted some peculiarly malign local influence not made out, or special family predisposition not understood—a fact we are called on frequently to deplore. For of at least 150 cases that we can reckon, and doubtless a large number of others among the negroes, who neither sought nor obtained medical assistance, scattered along both banks of the river, under bad hygienic conditions, crowded in close, damp, dark, ill-ventilated rooms, seen usually late and necessarily infrequently, with no nursing or worse, lifted out of bed or seated up for every occasion, in every stage of the disease, and fed or starved as fortune favored—improperly and unseasonably often, and as the waking or the whim of the nurse chanced; out of this large number of cases, as we have said, but two deaths have occurred. Yellow fever, whenever it prevails—so far as I know—stands high among the most fatal diseases of our nosological table.

Nor is there any hint of such a march of the disease from house to house, or by personal contact, as can almost always be traced in contagious diseases breaking out among a sparse population, and never so easily traced as under such conditions as exist here, when the dwelling-houses are stretched along in one continuous and unbroken line, following the curves of the levee under which they lie.

What are the facts? Dr. Westerfield told us that his first cases occurred early in August, and by the tenth, after a pause of a few days, the whole settlement was involved. Dr. Hays gives a somewhat similar history of his section; but his first case did not occur until the 15th of August. Now the middle of Dr. Westerfield's line is directly opposite the quarantine station. Dr. Hays' practice lies many miles above. And at first sight this might seem to furnish a clue to the source of the disease, if it were yellow fever, although we know of but one infected ship, the Excelsior, at quarantine this summer, though of course many ships from infected ports have been detained there from time to time. The solution of the phenomenon, granting the disease to be malarial, is not far to seek. Owing to the shorter distance to the Gulf, and the natural configuration of the land, drainage in the lower is much more rapid than that in the upper part of this area. Mr. F. C. Brooks, a planter of the neighborhood, informs me that, although the rice matures in both sections about the same time, the difference in the time of drainage (the water being let off the fields simultaneously) is from seven to ten days, nearly. As the water is let off usually about the middle of July, the fever, as might have been anticipated, made its appearance along the river from below upwards just so soon as the hot sun of July and August could draw up from the reeking ground the miasm which, whatever its specific nature, is doubtless telluric in its origin.

Finally, the epidemic now prevailing in the parish of Plaquemines is, unhappily, not confined to the lower coast. Along both banks of the river as far up as Donaldsonville, in Jefferson, in Saint John Baptist, Saint Charles, Saint James, and Ascension, I am informed by my friends—physicians and planters—that the same or a similar fever exists. Since the latter part of June I have treated in New Orleans a fever identical with that which I found in Plaquemines, invariably remittent, and many of them far more serious than any which I saw below. A few days only before I started on this mission I had treated for a severe remittent the clerk of the *Alvin*, a packet in the lower coast trade. He was seized with the fever on the coast and brought to the city with it.

And this widespread outbreak of malaria, during the present summer, is generally attributed by the residents along the river, above and below, to the increased acreage under cultivation in rice. In a letter from Dr. E. Duffel, of Ascension, dated September 13, and received on my return, that most competent observer says: "I am very busy, having a great many cases of malarial fevers, at times very fatal, particularly if neglected at first. One of the worst complications is congestion of the brain, and few, if any, recover when thus affected. The extensive cultivation of rice in Louisiana will be very detrimental to the health of the people and a scourge."

A planter on the lower coast tells me that eight or nine years ago malarial fevers were comparatively infrequent and mild in that section, but have increased in numbers and severity just in proportion to the increase of the rice area. I do not doubt the truth of the statement, which is in strict accordance with all we know of the history of rice culture and its connection with miasmatic fevers elsewhere, notably in South Carolina and Georgia. In Louisiana two potent causes will contribute to the increased cultivation of this cereal. The poor man will give a natural preference to a crop which can be raised with small expenditure of labor and which needs no capital to take it off, and the wealthier sugar planter finds in it a valuable accessory to his main crop, harvested early, commanding cash readily, and furnishing, at the very season he most needs it, the large outlay required to convert his standing cane into a marketable commodity.

Whether the health of New Orleans will thus be endangered only time can show; but that our hitherto salubrious lowlands, if turned into paddy fields, will become hotbeds of malaria, hostile to the health and perhaps fatal to the presence of the white race, there is little reason to doubt.

I have the honor to be, very respectfully, your obedient servant.

J. DICKSON BRUNS, M. D.,
Chairman Committee on Fever of Lower Coast.

I concur with the above full and able report regarding the disease prevailing on the Lower Mississippi coast as essentially a miasmatic fever of a remittent type, occasioned by the emanations from the rice fields stretched along the coast, and its diffusion over so extended an area as probably due to the peculiarities of the present season, characterized as it has been by long-continued rains, followed, at harvest time of the rice, by very hot and dry weather. I saw no case of the fever which, in my judgment, could be said to present the diagnostic signs of yellow fever.

J. P. DAVIDSON, M. D.

S. M. BEMISS, M. D.,
Resident Member National Board of Health.

NEW ORLEANS, October 5.—Dr. F. Loeber, acting president of the Louisiana state board of health, sends the following dispatch to the National Board of Health,

through Dr. S. M. Bemiss, resident member in New Orleans:

One death from yellow fever on the night of September 4, at No. 409 South Liberty street, nearly a mile from the commercial centres, and the same distance from the harbor. Immediate burial, disinfection of premises have been enforced, and all precautions will be taken.

THE WATER SUPPLY OF CHARLESTON, S. C.

Capt. J. C. Post, of the Engineer Corps of the United States Army, having examined the water works and supply of the city of Charleston, submits the following report:

UNITED STATES ENGINEER OFFICE,
Charleston, S. C., September 14, 1880.

DR. J. L. CABELL,
President National Board of Health, Washington, D. C.:

SIR: Having been detailed by the honorable Secretary of War, at your request, to examine and report upon certain questions in regard to the manner in which the water company of this city were laying their pipes, I have to submit the following:

The questions to be examined into, as stated in your letter, were as follows: First, as to the fact of the perforation of drains and sewers by water pipes; second, as to the methods in which this has been done; third, whether there is probable danger of contamination of the water or causing mischievous obstructions in the sewers; and, fourth, whether, in view of such probable danger, it is practicable to carry the water pipes across the line of sewers without encountering such danger.

Immediately upon receiving a notification of my detail, in accordance with your request, I addressed a letter to his honor the mayor of this city, the honorable chairman of the city board of health, and to Dr. Manning Simons, requesting that I be supplied with such information as they possessed upon the questions at issue. In reply all of these gentlemen very cordially and readily placed at my disposal all the papers they had concerning these matters, and heartily co-operated with me to make the examination complete and thorough. The city council also voted an appropriation of $300 to meet the expenses of the examinations.

As the water company at this time had not completed the laying of their pipes, I thought that much information could be gained by observing the manner in which it was being done. I accordingly watched the operations to the full extent that my other duties would permit, and saw the pipes laid in several of the streets. I also had the opportunity of witnessing the opening of a portion of one of the streets where the water pipes had already been laid some months before, and which were being taken up in order to substitute pipes of larger size. In addition to this I obtained the location of all places that I had not seen where it was thought that the drains had been seriously injured by the passage of the pipes. All of these, with a single exception where a new pavement had just been laid, were opened and examined.

In all of the streets where I saw the pipes laid, and in nearly all of the places opened for examination, I found the pipes intersecting the drains. Generally, they passed through the crown of the drain arch and were only partly inside of it, but in one instance the top of the pipe formed a portion of the floor of the drain, while in some others the pipes passed through the drain below the arch, and were wholly in the drain. In all of these latter, with the exception of four places, sufficient room had been left between the pipe and the floor of the drain for the free passage of the drainage material. Of the four places excepted, in two of them the pipe lay directly on the floor of the drain. In another instance, where the level assumed for the pipes would have seriously interfered with the flow through a large drain, the latter was cut and an iron pipe was placed below the water pipe to connect the two portions of the drain.

The system used by the water company is what is known as the constant pressure system, and the water is distributed by means of cast-iron pipes into which it is forced, either by maintaining a proper height in the stand pipe or by pumping direct into the pipes.

Before considering the possibility of contamination incident to the intersection of the drains, I think it would be well for a better understanding to give a brief description of the present condition of the drainage of this city.

Charleston is situated on a low, flat peninsula lying between the Ashley and Cooper, both salt-water rivers. Its site originally consisted of a ridge or backbone of sand rarely more than half a mile in width, bounded generally on both sides by salt marshes covered at high water, which here and there extended a considerable distance into it. Much of this salt marsh has now been filled in and forms a portion of the city, being laid out in streets and occupied by buildings. As the city grew, the first necessity which presented itself was that some means should be provided for carrying off the surface water and prevent it from being absorbed with the street and yard washings by the naturally porous soil. This led to the construction of large drains in several of the principal streets, with street and yard laterals emptying into them. These drains were generally built of brick, and emptied into the rivers or marshes on either side of the city. The laterals were also generally built of brick, though sometimes partly of wood, and a few of the more recent ones are of terra cotta piping. In their construction little or no attention has been paid to giving them a uniform depth, proper size, or slope. They are found at all depths, from near the surface to near the level of the main drains; many are too large, others too small, while some have so little slope that they but partially serve their purpose.

The main drains not fulfilling all that was required of them, in 1856 a series of tidal drains was built through some of the streets, whose principal object was to dry the subsoil and supply water for fire purposes. They were constructed at a lower level than the main drains and connect with them. I am informed, only at the points of crossing, where they pass below them by vertical openings. The system of tidal drains, though very efficient in its action, has never been extended sufficiently to affect the entire city, and there is still a large portion where the subsoil is saturated to very near the surface. This was shown by the water rising and falling with the tide in some of the trenches opened while laying the pipes. In these, especially where the ground had been made, decaying vegetable matter was also exposed, and the effluvium given off was so offensive that resort to disinfectants became necessary. None of the drains have been built with a view of carrying off the contents of the house closets.

From the foregoing, it will be seen that the question of contamination is not merely one of contamination consequent upon intersecting drains, but one of possible contamination in a more general sense, for, if the water in the pipes would become polluted where they pass through drains, it would also become polluted in the pipes passing through streets where they lay in a soil saturated with the results of vegetable decomposition, the percolations from cesspools, and the seepings from yards and streets.

It is a well-known fact, that in many of the cities of this country, as well as of other countries, water pipes pass through drains and sewers, but, so far as I can learn, there is yet to be placed on record a single case where water, conveyed in cast-iron pipes under pressure, has been poisoned by the introduction of extraneous matter or gases through a hole or leak in the pipes. Not wishing to rely wholly upon this negative proof in so important a matter, I have resorted to practical experiments to obtain data bearing directly upon this point. To imitate as nearly as practicable the condition of a leaky iron pipe in a drain or sewer, a split piece of iron pipe was obtained and placed in a receiver that could be filled either with gases or liquids. This pipe, with a pressure gauge attached to it, was connected at one end with the water pipe by means of a rubber hose, the other end being left free for the water to flow out of it. For the first series of experiments the receiver was filled with sulphureted hydrogen, a gas readily absorbed by water, and the water for the first trial was turned on full head. After allowing it to run several minutes, some of the water was caught as it passed out of the free end of the pipe and tested for the gas. The water was then turned off until the gauge ceased to register a pressure on the inside of the pipe, and, after waiting several minutes, more of the water was caught and tested. Again the water was turned off so that it barely filled the pipe in passing through, when more of it was caught and tested. The tests in the first two experiments failed to detect the presence of any of the gas, while that of the third showed that a small portion had been absorbed.

These experiments were then repeated, substituting, for the gas surrounding the pipe in the receiver, sand saturated with a solution of a salt that could be easily detected. Tests were made of the waters obtained under these conditions, but none of the salt was detected in any of them. It is highly probable, however, that if the third experiment, in which the water did not fill the pipe, could have been prolonged for a sufficient time, some of the solution of the salt would have passed into it. All of these experiments were afterwards repeated, with practically the same results, in the presence of Dr. F. Geddings, of this city, who kindly consented to be present.

As a result of the examinations and experiments made, I would state that very many of the drains of the city are perforated by the water-pipes; that in some instances the yard and street laterals are seriously obstructed; but, so far as I could learn, none of the main drains, though many are also perforated, have been seriously affected. As to the contamination of the water while passing through the pipes, I feel justified in saying, from the results of the experiments, that it is practically impossible so long as care is taken to keep the pipes filled with the proper pressure. No leak, however small, can exist in a cast-iron water-pipe or a joint under pressure for any length of time without increasing in size and soon making itself known, either by tearing up the street or by showing a diminished pressure on the pipes should the leak or break occur in a drain where the water escaping might be carried off. In either of these cases, a properly organized water company would at once locate the break and repair the pipes. Perforations of drains and sewers by water-pipes should always be avoided as far as practicable, both on account of the probable decrease in the life of the pipe from the action of the gases and liquids and the possible obstruction of the drains and sewers, even though there is apparently sufficient room for the flow to pass beneath them. From what I have seen, it appears that it would have been practicable for the water company

to have laid their pipes so as to have avoided many of the drains that they now perforate. At the same time I do not believe that it would have been possible to have laid the pipes without perforating some of the drains where they exist at all levels as they do in this city.

Before closing this report I wish to acknowledge my thanks to Prof. C. W. Shepard, jr., of the Charleston Medical College, and his assistant, Mr. Robinson, for their valuable aid and assistance while conducting the experiments, and also to Dr. W. T. Wragg for his kindness in supplying me much important information.

Dr. Manning Simons, of Charleston, makes the following remarks on the above report, closing with an extract from the *Sanitary Record* of January 9, 1875, relating to water-pollution in the English town of Over-Darwen:

I received to-day the report of Capt. J. C. Post, United States Engineers, on the Charleston water works, and I send you this brief communication to complete the history of this matter.

Captain Post's report admits the perforation and obstruction of drains, so that this question is disposed of.

The effect on the public health of the obstruction of drains and the resulting collection of sewage, sewage-overflow, and percolation of soil, is too obvious to need comment.

In relation to the question of contamination of the water by the passage of the pipes through the drains, he says: * * * "So far as I can learn, there is yet to be placed on record a single case where water conveyed in cast-iron pipes under pressure has been poisoned by the introduction of extraneous matter or gases through a hole or leak in the pipes." I beg leave, in this connection, to submit, as a part of this history, an article in the "Sanitary Record, a journal of public health," published in England, entitled "The secret of Over-Darwen." The facts in this case are worth all the laboratory experiments that can be produced.

The epidemic in the case of Over-Darwen was due to water contaminated by sewage, through a leak in a water-pipe, and manifested great "ferocity." On this occasion 2,035 people were attacked, and 104 deaths occurred.

The report on the Charleston works indirectly defends the passage of the water-pipes through the drains, by alluding to the nature of the made-land of which portions of this city are composed.

Permit me, in this connection, to call attention to the fact that the report does not touch upon the manner of construction of the reservoir from which the water is to be distributed. This was spoken of particularly in my papers on this matter.

This reservoir is situated in the middle of the city; is sunk 22 to 25 feet (I cannot give the exact figures) *below* the surface, and between the water of the reservoir and the subsoil water and the "made-land," to which the report alludes, there is no other barrier than a few courses of brick and cement and a little puddled clay.

[From the Sanitary Record.]

THE SECRET OF OVER-DARWEN.

The materials for the history of the epidemic at Over-Darwen have been nearly completed. The secret of the outbreak is most impressive and deeply instructive. It has been worked out by Dr. Steven, whom Mr. Simon dispatched on behalf of the Local Government Board. The origin of the outbreak was strikingly simple, as we have the story on good authority. The details of course will be ascertained in the official report which will be shortly published. Typhoid fever, as Mr. Simon has never ceased to reiterate now for many years, is a "filth fever," and the specific poison is commonly conveyed by the excremental pollution of drinking-water, or of any other potable fluid, as in the Marylebone milk epidemic. The first case of typhoid imported into Over-Darwen occurred in a house at a considerable distance from the town. The sufferer contracted the disease, came home, and died with it. The distance of this house from the town, and the circumstance that its sanitary arrangements were held to be good, and that there was no apparent communication from the house with the water drank by the sufferers in the fierce epidemic, directed attention from this important case, which nevertheless proves to be the *vera causa*. On first inquiry it was stated that the town derived its water-supply from a distant and unpolluted source, and that the water was brought by covered channels into the town, and could by no possibility be polluted by the excreta from this first case. On the first aspect of the facts this seemed to be true. A more minute investigation revealed a startling contradiction of it. The drain of the closet into which the excreta of the first typhoid patient were passed emptied itself into a neighboring field, for agricultural purposes. Through this field passed also the water-main, conveying the water-supply of the bulk of the inhabitants of Over-Darwen. At the point of supposed contact of the pipe with the drains, special precautions had been taken to prevent any infiltration of sewage into the water, but when the earth was dug up to ascertain how far these precautions were efficient, it was found that just above the spot where the cement and other segregating materials had been placed, there was a leak, which allowed the contents of the drain to be sucked freely into the water-pipe, and thus, as the very typhoid poison itself was regularly thrown down the drain, it passed as regularly into the water-main, and was continuously mixed with the drinking-water of the people of Over-Darwen. Thus, on a large scale, was once more performed that shocking experiment which in surface-wells and poisoned rivulets all over the country is being frequently rehearsed. The drinking-water was mixed with a poison which is one of the most deadly that can be found in nature or devised by art. A similar experiment in the east of London produced a violent outbreak of cholera; in Over-Darwen it has produced an outbreak of typhoid. All over the country similar experiments are being tried, sometimes on a small scale and sometimes on a large scale; sometimes by placing the water-cistern of the house over the closet, and letting the overflow-pipe pass into the soil-pipe; sometimes by allowing untrapped sewer-pipes to open into dwelling-houses through closets or fixed water-basins, sometimes by drinking polluted well-water, and at others by draining a supply for whole communities from brooks and rivers liable to sewage pollution. There was a ferocity about the epidemic of Over-Darwen which arrested national attention, for 2,035 people were attacked within a very short period, and 104 deaths occurred. There is, too, a dramatic completeness in the discovery of the first cause which is impressive; but urban and rural sanitary authorities will do well to remember that if an inquest were held on every case of death from typhoid fever, as we have long contended there should be, a similar relation of fatal effect to preventable cause could nearly always be traced, and may always safely be presumed; yet of these deaths there are 20,000 annually in this country.

SANITARY SURVEY OF BAY SAINT LOUIS, MISS.

The following notes are taken from a sanitary survey of this place, made by Dr. E. Latham in September, 1880:

Bay Saint Louis is in Hancock County, Mississippi, about 15 feet above the sea level. The town was founded in 1715 and incorporated in 1850. Population in 1860 was 1,000; in 1870 it was 1,300; at present, estimated at 1,500 but increased to about 4,000 during the summer. About one-fifth of the population are foreigners. The adjoining country is level, and no grading has been done in the place. The land to the north and west is covered with pine forests, and on the south and east are the waters of the Mississippi Sound, which ebb and flow with the tides of the Gulf. No part of the city is subject to overflow. The surface soil is of white sand, and no malaria has been observed when the soil was disturbed. The water supply is from wells and cisterns; the former are usually 10 feet in depth, and placed at least 50 feet from the nearest privy. The city limits comprise about 16 square miles, and several ravines, opening into the sound, provide a good natural drainage. The line of dwellings on the principal street extends about 7 miles along the beach of the sound. There are about 400 dwellings in the corporate limits, mostly well built and wholesome residences. Garbage, &c., is thrown upon the beach, and carried off by the tide; dead animals are usually buried. There is a county board of health, organized in 1878, and composed of six members, who serve without salary. A record of deaths is kept by the clerk of the circuit court, but no system of registration of causes of death is regularly enforced. There are two cemeteries near the town, in good condition and well located; precautions are taken in all burials of persons having died of contagious diseases. During the summer and autumn of 1878 yellow fever was epidemic in the town, and *dengue* fever now prevails. Cholera, small-pox, scarlet fever, diphtheria, and cerebro-spinal fever, have never been epidemic here, though small-pox is occasionally brought here from New New Orleans. Of *dengue* fever there have been about 400 cases this season, of which only four proved fatal, and in these there were complications. The disease was developed during a season of very dry weather, with warm days and cool nights, northerly winds prevailing.

QUARANTINE LAWS OF SOUTH CAROLINA (additional).

Dr. Robert Lebby, health officer of Charleston, S. C., having omitted the legislative acts of 1872 in his abstract published September 18, in No. 12 of the BULLETIN, forwards the following:

ACTS, 1872.

Act of 1868, sec. repeated as to Hilton Head, and anchorage located on the north side of Paris Island, quarantine. For St. Helena Sound it shall be as heretofore, at Morgan's Island, and a health officer appointed by the governor for two years with same compensation as the one at Hilton Head and Georgetown.

No dead bodies shall be transported when deceased from contagious or infectious diseases, to any of the cities or towns on the coast without permission from the Health Officer of Charleston between 1st April and 1st December, under penalty of $1,000, as a misdemeanor.

All permits issued by health officers shall be at the expense of the

vessel or conveyance to which such permits may be issued, and shall be collected by the health officer issuing the same. Reports of officers from Georgetown, Hilton Head, and St. Helena Sound, to the governor, abolished, and they must report to health officer at Charleston, who must make a consolidated report to the governor monthly and the legislature annually.

YELLOW FEVER AT KEY WEST, FLA.

R. J. Perry, health officer at Key West, sends the following dispatches relating to cases of yellow fever at that place:

October 4. One yellow-fever case died last night: adult, case of relapse in *dengue* from exposure.

October 7. A case of suspected yellow fever proved fatal yesterday; patient sick eight days. Another death occurred this morning, following a continued debauch, and is reported as yellow fever. These deaths were among strangers, and no new case is reported.

ABSTRACTS FROM CONSULAR REPORTS.

COLOGNE, GERMANY.—The report from this city shows a total of 764 deaths for the six weeks ending July 24, the greatest number being 116, for the week ending July 10, giving an annual rate of 42.8 per 1,000, the population being 141,000. Of the decedents, 229 were under one year of age. Among the causes of death were measles 37, scarlet fever 27, diphtheria and croup 16, whooping-cough 3, enteric fever 3, diarrheal diseases 7, acute lung diseases 31.

GUAYMAS, MEXICO.—The report for the month of August gives a total of 23 deaths, of which 17 were of children. The health of the foreign population is generally good.

LYONS, FRANCE.—The report for the week ending August 7, gives 6 deaths from small-pox, and four from enteric fever; these diseases, with scarlet fever, measles, and whooping-cough, are prevailing. There were 156 births, being at the annual rate of 23.4 per 1,000; the deaths were 184, giving an annual rate of nearly 28 per 1,000.

SINGAPORE.—The report of United States Consul A. G. Studer, for the month of July, gives a total of 373 deaths, of which 124 were from "fever," 25 from consumption, 20 from acute lung diseases, 39 from dysentery, 13 from diarrhœa, and 11 from old age. The city and district continue to be free from epidemic and contagious disease.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—For the week ending September 21, 16 deaths from yellow fever are reported, of which ten were in the city, and 6 in the military hospitals. The following vessels are reported as infected with yellow fever: Spanish ship Voladora, for New Orleans, September 24; Spanish bark Carlos, to sail for Shieldsborough, Miss., September 24; the American bark Rachel, which came to Havana in ballast from Matanzas, and loaded with sugar at an infected wharf, sailed for Boston September 24, with a case of the fever on board. Small-pox is again on the increase, 10 fatal cases having occurred during the week ending September 24.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

Summit, Miss., 1,808; no deaths. Tampa, Fla., 734; no death. Titusville, Pa., 9,000; no deaths. Verona, Miss., 1,600; death, 1; malarial fever 1. Winchester, Va., deaths, 4; under 5 years, 2. Winona, Minn., 10,000; deaths, 2; consumption 1; puerperal 1. Youngstown, Ohio, 15,089; deaths, 7; under 5 years, 3; consumption 1; diarrhœa 2; lung disease 1; accident 1. Total population, 354,485; deaths under 5 years, 32; total deaths, 114; annual rate per 1,000, 16.9.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, OCTOBER 16, 1880. [No. 16.

THE PROPOSED STATE BOARD OF HEALTH FOR VERMONT.

Below will be found the draft of an act to establish a State board of health and vital statistics, which is coming before the legislature of the State of Vermont at its present session.

It is to be hoped that nothing will occur to delay or prevent the passage of this act, for it is certainly time that Vermont should provide for such an important part of the duty of a State to its citizens as is connected with the care of the health of the people, and the registration of all births, marriages, and deaths within her borders. It is not clear from the terms of the act as to what the salary of the secretary is to be, for it cannot be supposed that it is to be included in the clause which provides that the whole expense of the board for services rendered shall not exceed five hundred dollars per annum. To perform the duties required of the secretary of the board by this act will require the whole time of a professional man, and he should be paid accordingly. It is poor policy and bad economy to either offer or accept insufficient pay for services of this kind.

PROPOSED ACT TO ESTABLISH A STATE BOARD OF HEALTH AND VITAL STATISTICS FOR THE STATE OF VERMONT.

It is hereby enacted by the general assembly of the State of Vermont:

SECTION 1. The governor, by and with the advice and consent of the senate, shall appoint six persons, who, with a secretary, appointed as hereinafter provided, shall constitute a State board of health and vital statistics for the State of Vermont.

The terms of office of the persons so appointed shall be so arranged that the terms of two of them shall expire at the end of every second year. Vacancies in the board shall be filled by re-appointment or otherwise by the same appointing power.

SEC. 2. The board shall meet immediately upon receiving notice of their appointment, at such time and place as the first-named member of the board shall designate; shall organize by the election of a president, who shall be one of their number, and of a secretary, who shall be a physician, and if not one of their number by appointment, shall by such election become a member *ex officio* of the board, and shall hold the office of secretary until another is elected.

SEC. 3. The board shall take cognizance of the interests of life and health among the inhabitants of the State, shall make, or cause to be made, sanitary investigations and inquiries respecting the causes of diseases, especially of epidemics, and the means of prevention; the sources of mortality, and the effects of localities, employments, habits, and circumstances of life on the public health; they shall also investigate the causes of epidemics and other diseases occurring among the stock or domestic animals of the State, and the methods of remedying the same, and shall gather information in respect to these matters and all other kindred subjects, which shall be committed to the board for diffusion among the people in such manner as they shall deem best. They shall also, when requested, or when in their opinion the sanitary interests of localities require it, advise with regard to the location, drainage, water supply, heating and ventilation of public buildings, and the drainage and sewerage of towns and cities.

SEC. 4. The board shall meet biennially on the second Thursday of the session of the legislature at Montpelier, and at such other times and places as in the judgment of the board the public health may require. The secretary shall be the executive officer of the board; shall superintend and perform the work prescribed in this act, and perform such other duties as the board shall direct. He shall deliver, or cause to be delivered, at least one public lecture on sanitary science and the laws of public health in each county of the State during each year; shall respond to the instructions of the State board, or to the invitations of the local boards of health, hereinafter provided for, in case of epidemics, contagious diseases, or other unusual sickness, by visiting the locality, or in such other way as may be deemed best; shall render the secretary of state any necessary assistance in preparing for publication the annual registration reports required by law, relating to births, marriages, and deaths, in the State, and shall annually report to the governor on or before the first day of August in each year the investigations, discoveries, and recommendations of the board, which shall be printed and distributed as soon as practicable thereafter, in the same manner as other public documents of the State, and the whole expense of the board for services rendered shall not exceed five hundred dollars per annum.

SEC. 5. The selectmen of each town, the mayor and aldermen of each city in the State, shall constitute a board of health, *ex officio*, for each of the several towns and cities of the State, of which the first selectman of each town and the mayor of each city shall be chairman. They shall annually, on the second Tuesday of March of each year, complete their organization by the election of a secretary, who shall be a physician, and who shall be allowed such compensation from the town or city treasury as the local boards shall direct. The local boards shall act in conjunction with the State boards in carrying out the practical intent and operations of this act, and it shall be the duty of the secretary of such local boards at least once in a year, and oftener if requested, to report to the State board of health such facts and statistics as may be required under instructions from the State board.

SEC. 6. The city or town boards of the locality concerned shall have authority, under the direction of the State board, to promulgate and enforce such regulations for the better preservation of the public health in contagious and epidemic diseases as they may deem best, and any person or persons, or corporations, neglecting or refusing, after having been duly notified in writing, to comply with the requirements of such regulations, shall, upon conviction thereof, pay into the State treasury a fine of not less than five nor more than ten dollars for each and every such offense, to be recovered upon complaint of any grand juror of the several towns or cities, before any justice of the peace competent to try the same.

SEC. 7. This act shall take effect from its passage.

ABSTRACTS FROM CONSULAR REPORTS.

BUCHAREST, September 14.—United States Consul-General Eugene Schuyler sends the following report on the sanitary condition of that city:

In sending the reports of the sanitary condition of Bucharest for the weeks ending July 31 and August 14, 1880—the only two which I have received since my residence here—I desire to call your attention to the fact that only about one-half of the total number of deaths are specifically accounted for. The reason of this is probably that the causes are mentioned only for the deaths occurring in the hospitals.

It may not be out of place for me to state certain general facts with regard to the city and its population.

Bucharest, which is situated on both sides of the small river Dambovitsa, latitude 44° 25′ N. and longitude 26° 24′ E., is, at its lowest point, 266 feet, and at its highest, 344 feet, above the level of the Black Sea, and covers a superficies of over 13,158 acres. Of these, 1,922 acres are covered with houses and court-yards, 1,141 with streets and public places, and the remainder with gardens, orchards, and uncultivated ground. The houses are nearly all of one or two stories, built either of wood or brick and covered with stucco, and generally surrounded by gardens. According to the census of 1878, there were 20,323 edifices in the city, of which 121 were churches and synagogues. This shows an increase of 6,203 buildings since 1859. About five per cent. of the streets are tolerably well paved; the remainder are either unpaved or worse than unpaved with cobble stones of varying sizes covered with dust and mud on alternate days.

There are few sewers, and the drainage is very bad. The climate is one of extremes, reaching very excessive heat in summer, and a cold of 25 degrees below zero centigrade in winter. According to the census of 1878 the population is 177,646, an increase of 55,912 over the census of 1859. Of the 177,646 population in 1878, there were 82,632 men and 95,014 women. According to religion 20,749 were Jews, 43,000 Mahommedan, and the remainder Christians, including 20,000 of other creeds. Twenty-six thousand six hundred and eighteen of the men, or 32.2 per cent., and 72,031 women, or 74.1 per cent., cannot either read nor write.

The movement of the population in Bucharest is not satisfactory. According to the general report of the sanitary service in 1877, made by Dr. Felix, there were born 5,632 living children—162 less than in 1876, and still-born 64 in 1877, as compared with 81 in 1876. Of these 5,632 children, 4,292 were born of married parents, 1,199 were illegitimate, and 141 were foundlings; that is, about one in five was illegitimate. The number of marriages in 1876 was 897; in 1877 it fell to 663. This was probably in consequence of the war. In the first nine months of 1878 there were 794 marriages. In 1877 the number of deaths was 5,734, being 855 more than in 1876, and 266 more than

the births. As will be seen by the weekly statistics, the number of deaths as a general rule is greater than that of the births. The mortality is especially noticeable in children, and is, no doubt, greatly due to the bad hygienic condition of the city.

While in the Christian population the number of deaths in a year is greater than the number of births, the contrary is the case in the Jewish population, and the same thing has been observed in other towns and districts. For instance, observations in 1871 show that in eight towns, where there is a large Jewish population, in every case the number of deaths in the Christian population exceeded that of the births, while in the Jewish population the number of births exceeded that of the deaths.

The relations between births and deaths in the eight towns in 1871, were as follows: In the Christian population, total births 7,351, total deaths 10,314; excess of deaths over births 2,963. In the Jewish population, total births 4,668, total deaths 2,906; excess of births over deaths 1,762.

The sanitary condition of Bucharest is intrusted to one physician-in-chief, nine communal physicians, two veterinary surgeons, five vaccinators, and five midwives. A council of hygiene aids the communal administration. In the year ending September 1, 1878, 1,900 children were vaccinated and 249 persons were revaccinated, being in all 370 more than in 1877. The communal physicians in the same period assisted 3,279 sick persons, and the midwives assisted 152 women. In 1877 there were in Bucharest 105 doctors, 6 surgeons, 31 veterinary surgeons, and 4 dentists.

There are in Bucharest a number of good hospitals, the statistics of which I shall endeavor to send on another occasion.

LISBON, PORTUGAL.—United States Consul H. W. Diman sends the following report, under date of September 23:

I some time since received a circular from the Department of State calling my attention to the fact that the weekly returns of deaths were not sent from Setubal in this consular district. Setubal is a small place and no report of deaths is published. Lisbon and Oporto are the only places in this consular district where reports of the deaths are published, and these reports are sent regularly.

The sanitary condition of Lisbon is very good, no epidemic or contagious diseases prevailing.

During the early part of the season there was considerable fever, typhoid fever of a mild type, and much alarm was felt. There were, however, but few deaths. It was confined to certain districts, and was attributed to bad drainage. An extensive and perfect system of drainage is contemplated here, and foreign engineers have recently been making surveys with that object in view.

On the 1st of next month an abundant supply of water will be introduced into Lisbon from the river Alviella, which cannot but have a most beneficial effect on the health of the city.

SINGAPORE.—United States Consul A. G. Studer reports, under date of August 30, that there has been no epidemic or contagious disease in his consular district since his last report.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—Under date of September 21 Dr. E. Melon reports that since August 16, 6 new cases of small-pox have occurred, making a total of 8 cases. Of these 3 have recovered and 5 are still under treatment. None had ever been vaccinated, and the cases were all derived from the same source of infection. There is some reason to apprehend a spread of the disease, as there are many unprotected persons in the city, and a very limited supply of good vaccine virus; neither is there any hospital or other arrangement for isolating the cases.

HAVANA, CUBA.—During the week ending October 1 there were 14 deaths from yellow fever, and 78 for the month of September, 12 of which were among citizens and 38 in the military hospitals. There are supposed to be 55 cases in the city at present. The cases occurring on the Carlos, which sailed for Shieldsborough, Miss., September 26, were at once sent ashore or to hospital.

JAPAN.—Dr. Thomas H. Streets, U. S. N., with his report for the month of August from the United States Naval Hospital at Yokohama, under date of September 18, states that the American bark *Obed Barter* sailed from that port September 9 direct for New York. She was dispatched by the China and Japan Trading Company, and her cargo consisted of rags, most of which were taken aboard at Kobé, Japan, and the remainder at Yokohama. As a severe epidemic of cholera prevailed last year over the whole region whence the rags were collected, Dr. Streets reports the vessel as an object for attention. He recommended sanitary precautions, which were not observed, and in giving a clean bill of health he noted therein the suspected nature of the cargo.

MEXICAN DELEGATES TO THE SANITARY CONVENTION.

Hon. W. HUNTER, acting Secretary Department of State, addresses the following note to the National Board of Health, under date of October 5:

Referring to the subject of the proposed international sanitary conference to be convened in this city on the 1st day of January, 1881, I have now to inform you that, in reply to the invitation sent through the minister of the United States at the city of Mexico, the government of that country has appointed Señor Don Juan N. Navarro and Señor Don Ignacio Alvarado to represent the Mexican Government at such conference. Señor Navarro is at present the Mexican *charge d'affaires (ad interim)* in the United States.

MISCELLANEOUS.

The following communication has been received from the board of health of Charleston, S. C.:

OFFICE BOARD OF HEALTH,
Charleston, S. C., September 30, 1880.

SIR: I beg to transmit the following resolution adopted at a meeting of the board of health of this city, held September 29, 1880:

"Whereas, No. 12, Vol. II, of the official Bulletin from the National Board of Health September 18, 1880, and a previous associated dispatch coming from that body, contains a report (from a physician of the United States Marine Service located here) to the effect that there existed, at that time in the city of Charleston, an epidemic of break bone fever, and that there were 2,000 cases then under treatment; and whereas this board (in conjunction with the State board) being in accord with the National Board in all matters concerning the public health, and considering that any official information should emanate from and be transmitted through them to the national body; and whereas such information is calculated to injure our commercial prosperity and prejudice our sanitary condition: Therefore

"*Be it resolved*, That the chairman be requested to transmit a copy of this preamble and resolution to the National Board of Health in relation to the same, and protest against the action of the National Board in publishing statements concerning the health of this city without consultation with the officials authorized and empowered to give information of the health of the locality placed under their control."

Very respectfully,

B. F. MOISE,
Chairman Board of Health, City of Charleston.
H. B. HULBECK, M. D.,
Clerk Board of Health.

T. J. TURNER, M. D., U. S. N.,
Secretary National Board of Health.

In connection with the above, attention is called to the following section of the "Act to prevent the introduction of contagious and infectious diseases into the United States," approved June 2, 1879:

SEC. 4. It shall be the duty of the National Board of Health to obtain information of the sanitary condition of foreign ports and places from which contagious and infectious diseases are or may be imported into the United States, and to this end the consular officers of the United States at such ports and places as shall be designated by the National Board of Health shall make to said Board of Health weekly reports of the sanitary condition of the ports and places at which they are respectively stationed, according to such forms as said Board of Health may prescribe; and the Board of Health shall also obtain, through all sources accessible, including State and municipal sanitary authorities throughout the United States, weekly reports of the sanitary condition of ports and places within the United States; and shall prepare, publish, and transmit to the medical officers of the Marine Hospital Service, to collectors of customs, and to State and municipal health officers and authorities, weekly abstracts of the consular sanitary reports and other pertinent information received by said board; and shall also, as far as it may be able, by means of the voluntary co-operation of State and municipal authorities, of public associations and private persons, procure information relating to the climatic and other conditions affecting the public health; and shall make to the Secretary of the Treasury an annual report of its operations, for transmission to Congress, with such recommendations as it may deem important to the public interests; and said report, if ordered to be printed by Congress, shall be done under the direction of the board.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING OCTOBER 2, 1880.

The following reports, for the week ending October 2, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 4; under 5 years, 3; consumption 1; croup 1. Allegheny, Pa., 78,000; deaths, 12; under 5 years, 3; consumption 1; diphtheria 1; pneumonia 1. Bath, Me., 8,000; deaths, 8; under 5 years, 1; consumption 3; diarrhœa 1; diphtheria 1; old age 3. Belfast, Me., 5,308; one death. Brattleboro', Vt., 6,000; pneumonia 1. Bucyrus, Ohio, 3,950; 1 death, diarrhœa, under 5 years. Carrollton, Miss., 600; no deaths. Cedar Keys, Fla., 600; deaths, 2; consumption 1; malarial fever 1. Chillicothe, Ohio, 11,000; no deaths. Circleville, Ohio, 6,400; deaths, 1; consumption 3; malarial fever 1. Clinton, Mich., 1,205; no deaths. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 953; one death, under 5 years. Dallas, Tex., 10,300; deaths, 3; under 5 years, 1; diarrhœa 1; enteric fever 1; malarial fever 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 100; no deaths. Fernandina, Fla., 3,000; deaths, 2; consumption 1; puerperal 1. Helena, Mont., 3,630; deaths, 2; whooping cough 2, under 5 years. Hernando, Miss., 1,000; one death. Huntingdon, Pa., 4,500; old age 1. Huntingdon, Tenn., 1,200; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; deaths, 5; puerperal fever 1; old age 1. Kenosha, Wis., 5,500; deaths, 2; diarrhœa 1; pneumonia 1. Lebanon, Pa., 9,000; deaths, 1; under 5 years, 2; consumption 1; enteric fever 1. Louisiana, Mo., 5,200; no deaths. Meridian, Miss., 4,013; deaths, 2. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; no deaths. Monmouth, Ill., 6,000; deaths, 2; under 5 years, 1; consumption 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; one death, under 5 years. Muskegon, Mich., 11,300; deaths, 2, under 5 years; enteric fever 1; malarial fever 1. Painesville, Ohio, 5,500; deaths, 2; under 5 years, 1; diarrhœa 1. Pass Christian, Miss., 4,000; deaths, 2; under 5 years, 1; croup 1. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; deaths, 2; consumption 1. Pleasant Hill, Miss., 253; no deaths. Plymouth, Mich., 3,000; deaths, 2; enteric fever 1; malarial fever 1. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rock Island, Ill., 12,000; deaths, 3; consumption 1; malarial fever 1; old age 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 2. Summit, Miss., 1,800; malarial fever 1. Tampa, Fla., 740; old age 1. Titusville, Pa., 9,000; croup 1, under 5 years. Tuskaloosa, Ala; 2,000; death, 1, under 5 years. Winchester, Va., 5,000; deaths, 3; under 5 years, 1; consumption 2; pneumonia 1. Winona, Minn., 10,000; deaths, 4; under 5 years, 2; enteric fever 1. Youngstown, Ohio., 15,089; deaths 1; consumption 1. Total population, 313,838; deaths under 5 years, 24; total deaths, 86; annual rate per 1,000, 14.3.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, OCTOBER 23, 1880. [No. 17.

MONTHLY REVIEW OF MORTALITY FOR SEPTEMBER, 1880.

There is a loss of 278,793 in the mean population represented in the reports for this month, as compared with those for August. The death-rate for the whole country has fallen from 21.56 to 20.41, taking the mean rate for this month and the last; but on comparing the first week of August with the last week of September the reduction is from 22.75 to 19.90. The mean rate of infant mortality, which last month showed a fall of 40 per cent. as compared with that for July, is declining more slowly, the mean for this month being 17 per cent. less than that for August. Taking the extremes for this month and the last, the reduction has been from 10.95 to 8.13, or nearly 26 per cent.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Causes of death.—Consumption and acute lung diseases, having increased about 8 per cent., are now at the head of the list of death-rates, showing a mortality of 3.95, while diarrhœal diseases have fallen to a rate of 2.77. This loss of 43 per cent. since last month is not the greatest change of rate noted in the table. Diphtheria and croup show an advance of 50 per cent. since last month, while malarial fevers have increased their death-rate from 0.42 to 0.65, or 55 per cent. The general movement of six principal zymotic diseases has been as follows: *Increased*—diphtheria from 0.58 to 0.89, or 53 per cent.; enteric fever from 0.49 to 0.56, or 14 per cent.; malarial fevers from 0.42 to 0.65, or 55 per cent. *Decreased*—scarlet fever from 0.34 to 0.29, or 15 per cent.; measles from 0.09 to 0.06; whooping cough from 0.24 to 0.21, or 12 per cent.

One of the most notable changes in this class of diseases is the rapid subsidence of the death-rate from measles, which lately stood high among the causes of death. Scarlet fever is also declining, but the marked increase in diphtheria and enteric and malarial fevers causes the total death-rate from the six diseases noted to be more than 23 per cent. above that for August. Of the 42 deaths from small-pox noted this month, 28 were in Philadelphia, 6 in Camden, N. J., 3 in New York City and Brooklyn, 2 in Chicago, and 3 in San Francisco. For reasons previously given, these reported deaths afford no reliable indication of the extent to which this disease may prevail in any place, but the reports and correspondence show a tendency to increased prevalence of small-pox throughout the country. The statement made in the review for August, that no yellow fever had appeared at any of the exposed points on the coast, must now be modified in view of the acceptance by the National Board of Health of the report of Dr. Geo. M. Sternberg, U. S. A., as published in No. 15 of the BULLETIN. The report declares the fever which has prevailed since August on the Lower Mississippi, but which is now rapidly subsiding, to have been yellow fever of mild type, and causing in most places but a small mortality. No special measures of isolation or quarantine were adopted, but the disease did not spread beyond the districts first infected. The epidemic of *dengue* fever in the South, extending from Louisiana to South Carolina, which is fast disappearing, has affected a large number of people, but caused comparatively few deaths.

Distribution of diseases.—In comparing the death-rate in the three sections of the country it is to be remarked that both consumption and acute lung diseases, while showing in the Northeast and Southeast sections the gradual increase of death-rate to be expected from the change of season, exhibit a considerable decline in the Northwest. At the same time, diphtheria and croup have increased in that section from 0.73 to 1.27, or 74 per cent., having risen 41 per cent. in the Northeast and 48 in the Southeast. Scarlet fever shows but a small reduction in the Northeast and Northwest, but in the Southeast has fallen from 0.47 to 0.25, or 47 per cent. Diarrhœal diseases are declining rapidly in all sections, having fallen since last month 45 per cent. in the Northeast, 34 per cent. in the Southeast, and 50 per cent. in the Northwest. Enteric fever continues to increase in the Northeast and Southeast, having advanced 11 and 17 per cent. in those sections, respectively, but the rate re mains stationary in the Northwest. In the latter section whooping cough shows a decline of 40 per cent., while it has been reduced but 7 per cent. in the Southeast, and in the Northeast has the same rate as last month. The general increase in the death-rate from malarial fevers is most evident in the Southeast, where the rate has risen from 0.88 to 1.70, or 93 per cent.; in the Northwest the increase is from 0.48 to 0.75, or 56 per cent.; and in the Northeast the rise is only from 0.27 to 0.31, or 15 per cent. A rapid decline in these fevers is to be expected after the appearance of frost.

SANITARY DECREE FOR THE PHILIPPINE ISLANDS.

The Department of State forwards a note from the Spanish Minister, Señor Félipe Mendez de Vigo, dated September 22, informing the United States Government that the sanitary law of Spain, bearing date of November 28, 1855, is to be enforced in the Philippine Islands. The following decree has accordingly been issued:

MINISTRY OF THE COLONIES.

Decree.

In compliance with the suggestion of the director-general of civil administration, I hereby decree as follows:

1st. The organic sanitary law of the kingdom, dated November 28, 1855, with all modifications which have been subsequently made therein, is declared operative for the time being in these islands.

2d. The sanitary dues established by the said law shall be understood to be increased in the proportion of from a *real sencillo* to a *real fuerte*; but according to article 51, chapter 10, of the same law, the increase shall not be required until the expiration of six months from the date of the publication of this decree.

3d. A board is hereby appointed to prepare special maritime sanitary regulations for this archipelago, said board to be composed of the following persons: Don Antonio Garcia Triniño, physician attached to the navy; Don Alejandro de Churruca, captain of the port of Manila; Don Emiliano de Olano, ship-owner; Don Juan Antonio Candelas, sub-delegate of medicine and surgery; Don Ramon Ubeda, collector of customs; Don Enrique Gonzalez de Zurbano, commander of the corps of Carabineers; Don Ramon Ninvi, physician attached to the army; Don Francesco Capelo, ex-naval physician, who will perform the duties of secretary. The board will choose its own presiding officer during its first session.

4th. The regulations, which shall be prepared by the board in as concise a form as possible, shall, after having been submitted to the superior board of health and to the council of administration, be laid before the supreme government for its approval.

5th. The director-general of civil administration shall have charge of the enforcement of this decree.

FERNANDO PRIMO DE RIVERA,
Governor-General.

MANILA, *June* 5, 1880.

SHELBYVILLE, TENN.—Dr. C. C. Fite, president of the local board of health, writes, under date of October 11, that no epidemic or contagious diseases have lately prevailed in that vicinity, but there has been an unusual mortality among those affected with chronic diseases.

QUARANTINE NOTICE TO PILOTS AND MASTERS OF VESSELS.

SAPELO QUARANTINE STATION.—Dr. W. H. Elliott, inspector, forwards the following notice, issued by the authorities of Savannah, Ga.:

NOTICE TO PILOTS AND MASTERS OF VESSELS.

Quarantine order.

OFFICE HEALTH OFFICER,
Savannah, October 4, 1880.

On and after October 4, 1880, and until further notice, all coastwise vessels coming to this port from ports or latitudes south of Cape Hatteras, especially Key West, Fla., from all *foreign ports*, and any of the Gulf ports, shall be required to stop and remain at the lower quarantine station, opposite Cockspur Island, until inspected by the quarantine officer at that point, and granted by him a written permit to come up to the city. When considered necessary any or all vessels will be subjected to re-inspection by the health officer upon coming to the city.

Vessels from all ports, with sickness on board, on arrival or during voyage, shall remain at the quarantine station until visited and inspected by the quarantine officer.

Pilots and masters of vessels will be prosecuted to the extent of the law for any violation of this order.

By order of

JOHN F. WHEATON, *Mayor.*
J. T. McFARLAND, M. D., *Health Officer.*

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

AMSTERDAM, N. Y.—S. H. French reports, under date of October 11, one case of small-pox, said to have been contracted from exposure to contagion in Troy, N. Y.

BURLINGTON, VT.—Dr. George M. Ockford, under date of October 10, states that the mild form of scarlet fever prevailing in the city is increasing among the children attending the public schools. The disease appeared in one school soon after its opening, September 5, and has been confined to the children in attendance. Catarrhal diseases are becoming frequent with the variable weather incident to the change of season.

HAVANA, CUBA.—During the week ending October 8 there were 14 deaths from yellow fever; six among citizens and 8 in military hospitals. About fifty cases are believed to exist in the city at date of writing, October 9.

JEFFERSON, TEX.—Under date of October 16, Dr. A. P. Brown notes that malarial fevers are unusually prevalent in that vicinity, for the season of the year.

TAMPA, FLA.—The Surgeon-General of the Army forwards dispatches from Tampa, dated October 11, stating that a private soldier at Key West named Shute was taken with yellow fever on the 7th and died on the 11th. A girl was taken on the 9th, and her mother, a Mrs. Weaver, the next day. Later advices state that the mother died on the 13th, and the daughter will probably die.

In addition to the cases previously reported from Key West, Fla., by Dr. Porter, U. S. A., a dispatch, dated October 15, states that Private Hayes was taken with the fever on the 14th. The girl Mary Weaver died on the same day.

TUXPAN, MEXICO.—Dr. A. M. Boyd, health officer, reports for the month of August 15 deaths: 3 from malarial fevers, 1 from consumption, 2 from pneumonia, 1 from dysentery, 1 from jaundice, 2 from gastritis, 2 from epilepsy, and 3 from accidents. Annual death-rate, 27.8 per 1,000. No epidemic disease has prevailed during the month. A later communication gives the mortality for September as follows: Total deaths, 20; malarial fevers, 11; consumption, 3; diarrhœa, 1; epilepsy, 1; pneumonia, 1; gastritis, 1; scrofula, 1; accident, 1. Population, 7,186; annual death-rate, 33.3. General sanitary condition very good.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING OCTOBER 9, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

Huntingdon, Pa., 4,500; deaths, 2; under 5 years, 1. Huntingdon, Tenn., 1,200; death, 1; under 5 years, 1. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; death, 1; under 5 years, 1; diarrhœa 1. Kenosha, Wis., 5,500; death, 1; under 5 years, 1. Lebanon, Pa., 9,000; deaths, 2; under 5 years, 1; consumption 1; cronp 1. Louisiana, Mo., 5,200; deaths, 3; under 5 years, 1; enteric fever 1; lung disease 1; accident 1. Martinsburg, W. Va., 6,384; deaths, 3; under 5 years, 1; enteric fever 1. Massillon, Ohio, 6,876; death, 1; consumption 1. Meridian, Miss., 4,013; deaths, 2. Milan, Tenn., 1,800; death, —. Milledgeville, Ga., 3,000; no deaths. Montgomery, Ala., 17,000; deaths, 9; under 5 years, 2; consumption 1; diarrhœa 1; accident 1. Morton, Miss., 250; no deaths. Mount Pleasant, Iowa, 4,500; death, 1; consumption 1. Muscatine, Iowa, 8,412; no deaths. Niles, Mich., 4,200; no deaths. Okolona, Miss., 2,000; no deaths. Painesville, Ohio, 5,504; deaths, 3; enteric fever 1; puerperal 1; accident 1. Pass Christian, Miss., 2,500; deaths, 2; malarial fever 1. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,682; deaths, 2. Pleasant Hill, Miss., 253; death, 1; diarrhœa 1. Port Gibson, Miss., 1,200; deaths, 2. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 901; no death. Ripley, Miss., 1,000; deaths, 2; consumption 1; diarrhœa 1. Rock Island, Ill., 12,000; deaths, 7; under 5 years, 4; diarrhœa 2; lung diseases 2. Rockland, Me., 7,500; deaths, 2; consumption 1; diphtheria 1. Santa Cruz, Cal., 5,000; no deaths. Shelbyville, Tenn., 1,913; death, 1; lung disease 1; Springfield, Ohio, 21,000; deaths, 11; under 4 years, diarrhœa 2; enteric fever 1; malarial fever 2. Starkville, Miss., 1,454; death, 1. Steubenville, Ohio, 13,500; deaths, 4. Summit, Miss., 1,808; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; death, 1. Winchester, Va., 5,000; death, 1; lung disease 1. Winona, Minn., 10,000; death, 1; enteric fever 1. Youngstown, Ohio, 15,059; deaths, 4; under 5 years, 3; consumption 1; diarrhœa 2. Total population, 376,651; deaths under 5 years, 37; total number of deaths, 122; annual rate per 1,000, 16.9.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

DIAGRAM TO SHOW THE PROPORTION OF DEATHS PER 1,000 PER ANNUM AS RECORDED IN THE MORTALITY REPORTS FURNISHED THE NATIONAL BOARD OF HEALTH FOR THE FOUR WEEKS ENDING SEPTEMBER 4, 11, 18, AND 25, FROM THE FOLLOWING PLACES.

[The black lines represent mortality over 5 years; the white lines represent mortality under 5 years; both represent total mortality per 1,000 per annum.]

ABSTRACTS FROM CONSULAR REPORTS.

ACAPULCO, MEXICO.—United States Consul L. H. Foote reports for the month of July 357 deaths, in a population of 101,100, being at an annual rate of 42.4 per 1,000. The following causes of death are noted: lung diseases, 69; fevers, 62; small pox, 11; phthisis, 57.

BORDEAUX, FRANCE.—United States Consul L. A. Price reports for the month of July 19 deaths from small-pox, 11 from typhoid fever, and 26 from other contagions diseases. The deaths from all causes were 555, being at an annual rate of 30 per 1,000, in a population of 215,140. No contagions disease has been epidemic.

GHENT, BELGIUM.—The report of United States Consul S. Spackman for the month of August gives 1 death from cholera, 2 from small-pox, 13 from typhoid fever, and 5 from other contagions diseases. The total number of deaths was 105, and the population being 130,670, the annual death-rate was 37.2 per 1,000. Among other causes of death were: Diarrheal diseases, 217; consumption, 33; and other lung diseases, 10. The high death-rate is chiefly due to diarrhœal diseases among children.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webster reports for the month of June a total of 56 deaths, of which 2 were from typhoid fever, and 7 from other contagions diseases. The population being 27,500, the annual death-rate was 24.4 per 1,000. Of the 56 decedents, 27 were over 60 years of age; this large ratio of aged persons is due to the collection at Hobart Town of hospitals, asylums, and other institutions for the reception of the aged and sick from one-half of the colony. The city is admirably situated on a large tidal river; yet the drainage is still defective, and the health officer has to contend with such evils as cess-pools and a bad system of privies.

MAZATLAN, MEXICO.—United States Consul E. G. Kelton reports 93 deaths for the month of July. Population 11,000, giving an annual death rate of 79.7 per 1,000, yet the sanitary condition is rated as "fair." Among the causes of death were: diarrhœa, 10; fever, 18; and tetanus, 12. Mean temperature, 82°.

The recent rains had caused many pools of stagnant water in the lower part of the town, which has only surface drainage.

In August there were 67 deaths, giving an annual rate of 57.4 per 1,000. Diarrhœa caused 7 deaths, fever 15, and tetanus 15. Mean temperature, 84°.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer forwards a report for the month of July, showing 465 deaths in a population of 265,000, and an annual death-rate of 21 per 1,000. There were 11 deaths from typhoid fever, and 20 from other contagious diseases. Mean temperature, 47°.

MONTEVIDEO, URUGUAY.—United States Consul A. L. Russell reports for the month of June 234 deaths, of which 5 were from typhoid fever and 2 from other contagious diseases. The population being 111,500, the annual death rate was 25.2 per 1,000. Mean temperatur, 65°.5.

The report for July gives a total of 246 deaths, being at the annual rate of 26.5 per 1,000. Only 3 deaths are noted from contagious diseases, two of which were from typhoid fever. Mean temperature, 51°.

SAMOA.—United States Consul Thomas M. Dawson writes from Apia, Samoa, under date of August 28, that only monthly reports can be furnished from that place. No record of deaths is kept among the natives, nor can they be estimated by foreigners, as no public demonstration of any kind attends the interment of the deceased. In Hawaii there is always much display on such occasions. The contagions diseases named on the form of consular report of the National Board of Health are mostly unknown in these islands. The missionaries have vaccinated most of the people, but the consul has never heard of a case of small-pox among them. Dysentery is chiefly troublesome to foreigners; the natives suffer from an "influenza" in summer, from insufficient clothing and exposure to changes of temperature in their open huts. The most serious disease of the country is the *fee fee*, or *elephantiasis* (leprosy), which is common among the natives, and also attacks foreigners. The disease begins with enlargement of the legs, testicles, or arms, and beginning in childhood may not prove fatal till old age. In some cases the enlargement is attended with dropsical effusion; in others it seems quite solid. In adults the disease generally begins with chill and fever. Rev. George W. Turner, M. D., eleven years a missionary at Samoa, has in that time operated on 140 cases of *elephantiasis* affecting the testicles. In some cases both of the glands were saved; in others one or both were removed, the latter cases being those where the enlargement was solid. In one instance the organs and parts removed weighed 90 pounds. The disease does not generally interfere with the daily avocations of the patient, unless he is disabled by extensive ulceration, or the occasional attacks of chill and fever which are observed in leprosy. Foreigners may sometimes remain in the islands for many years without being affected, but most of them are attacked within a few months after their arrival. Consumption is not rare, and usually assumes a very rapid form. Venereal diseases are found, but are not prevalent in their worst degrees.

SANTANDER, SPAIN.—The report from this province of 235,300 inhabitants gives a total of 500 deaths for the month of July, being at the annual rate of only 12.5 per 1,000. The births during the same period were 526. Of the decedents 195 were under 5 years and 135 over 60 years of age. Among the causes of death were: Small-pox, 5; diphtheria and croup, 29; whooping cough, 4; enteric fever, 5; typhus fever, 9; dysentery, 9; puerperal fever, 3; scarlet fever and measles, 11. There were 47 deaths from consumption and 31 from acute lung diseases, while 63 were due to diarrhœal diseases, of which one-third were under 5 years.

SINGAPORE.—United States Consul A. G. Studer reports, under date of September 6, that his district continues free from infections or contagions diseases.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge reports for the month of September 90 deaths, of which 10 were from yellow fever; no other contagions disease noted. Annual death rate, 54 per 1,000. The mortality from yellow fever and some other diseases was among soldiers from the interior, and there is no fear of an epidemic among the citizens. Mean temperature, 88°.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, OCTOBER 30, 1880. [No. 18.

REPORT ON YELLOW FEVER AT KEY WEST, FLORIDA.

DR. S. D. KENNEDY, having been directed to investigate the epidemic of yellow fever at Key West, submits the following report, under date of October 19:

Key West is an island about seven miles long, having an average width of one mile and a half and an elevation of twelve feet above the sea-level. The city of the same name is situated at the west end of the island and has a population of about 14,000. It is unpaved and but imperfectly drained by sewers, or rather ditches. These are, with few exceptions, uncovered. Owing to the fact that the soil in which they are dug is very porous, and there being but little movement in them, their fluid contents are rapidly absorbed, a very small proportion being carried away from the city except in very hard rains. Thus, while this system is successful in keeping the city dry, it fails in other and more important points. There is always a large amount of decomposing organic matter scattered about the city, and, as far I as have been able to learn, it depends for its removal on the system of drainage mentioned above. Although the city has a "health office," and burial permits are required, no vital statistics are taken, nor are records of any kind kept. It is claimed that the public health was excellent up to the middle of July last, when a pernicious form of fever made its appearance. July 9, the schooner *Competitor* arrived at Key West, five days from Rock Sound, Bahamas. Among her passengers was a Mrs. Adongia Bastiom, who had lately lost three children with "fever." She does not know what kind of fever this was, but says her children vomited a dark fluid and turned very yellow before dying. She brought with her, as part of her baggage, mattresses, bedding, &c., but said that she had "smoked" everything used by her sick children. She now claims to have destroyed these things; but this contradiction is most probably due to a desire to escape blame. On her arrival Mrs. B. took up her residence at the house of her brother, William Carey, who lives on Grinnell street, near Eaton. On July 16th, a week after her arrival, Fletcher Brady, living on the same lot with Mrs. B., was taken ill. He was very intimate with the Careys and was frequently in their house. He was attended by Dr. Harris, who, although he kept no record of the case, gives me the following information: He found Brady with "high fever," and complaining of violent pain in his head and back; pulse rapid and bounding; his tongue was furred, and there was marked injection of the conjunctivæ. Later his tongue became dirty in the center and very red at the end. On the third day he vomited a light slimy fluid tinged with bile. Dr. H. did not test the urine, nor did he keep a record of temperature, but says that it continued to rise for two days and then gradually fell, being normal on the fifth day. Highest temperature about 104° F., on second day. Brady recovered. He had never had yellow fever. The diagnosis made was "congestive fever." A large number of similar cases followed this one, but no records were kept. Dr. H. gives me, also, the following information: "On September 5, Mary W. was taken sick with high fever, and pain in head and back. On third day of her illness she passed a bloody stool; delirious on fourth day; died September 10, having vomited a dark-colored fluid. After death, bled from mouth and nose. Diagnosis, 'congestive fever.'" No record of temperature. On September 9, daughter of Mr. W. died with "black vomit." Diagnosis in this case also was "congestive fever." On September 9, son of Mr. J. died of "congestive fever." Also, later on, in September, Mrs M. died; according to Dr. Sweating, having vomited genuine "black vomit."

There had been about one hundred and fifty cases similar to the above, all in the same neighborhood, when the following case occurred in the practice of Dr. Perry, health officer of Key West: George McClintock, age about 35 years, was taken ill September 27, at about 2 p. m. Temperature 101°; pulse "rapid"; complained of pain in head and back, and his eyes were slightly congested. The next morning Dr. Perry found him apparently well, and did not take his temperature. On September 29, McClintock rose from his bed and went into an out-house; was detained there about twenty minutes by rain, but did not get wet. At 3 p. m., on the same day, Dr. Perry found his temperature 103.5° and his pulse very rapid. His face was livid and his eyes bloodshot. On the morning of September 30 his temperature was 105.5°, and his pulse slower and weaker than the day previous. On October 1 his temperature began falling, and was normal on the morning of the 2d. He was then very much jaundiced, and vomited genuine "black vomit" at 2 p. m. Died October 3. Urine not tested. This case was diagnosed yellow fever, being the first acknowledged case this summer.

The next case occurred in the practice of Dr. Otto, at the United States barracks. Dr. O. gives the following information: Ordnance Sergeant Weaver, aged about 34, nativity unknown; had been in Key West three weeks; usually temperate, but was intoxicated October 3; taken ill October 4, early in the morning; was seen by Dr. O. at 2 o'clock p. m.; he had had a slight chill and complained of severe pain in head and back, especially over the kidneys; tongue coated; eyes very much congested; temperature 105°; pulse 130; vomited a large amount of greenish-yellow slimy fluid; urine scanty; the usual test for albumen (heat and nitric acid) showed the presence of a large amount. October 5, 2 p. m.: temperature 102.5°; pulse 110; nausea and vomiting continue; urine contains large amount of albumen. October 6, morning: temperature 98.6°; pulse 62; eyes and skin very yellow; black vomit at 9 o'clock p. m.; died October 7, at 8 a. m. On October 4, the youngest daughter of Sergeant W. was taken ill; had fever for several days and recovered; no notes were taken in her case. On the 7th Private Schute was taken ill; no notes were taken, but Dr. O. claims that he presented all the symptoms of yellow fever, including black vomit; Schute died October 11; urine not tested. On October 9, May W., another daughter of Sergeant W., was taken ill. The attack was initiated by a chill and pains in head and back. She was seen shortly afterwards by Dr. O., who gives her history up to my arrival, October 13. He says he found her with a temperature of 103°; pulse rapid; face suffused; eyes blood-shot and tongue coated. Her temperature remained 103° until October 12, when it began to decline. She complained of nausea, and soon vomited a viscid light-colored fluid, and later in the day (October 12) black vomit. On October 13 I saw the child myself, and found her temperature 101.5°; pulse 70; skin yellow and bathed in perspiration; tongue slightly coated, with fevery tip and edges. Her gums were spongy and bled on my scraping them with my finger nail, a small amount of epithelium coming away at the same time. Her gown and the bed linen were stained brown in many places, the stains exactly resembling those of black vomit. On inquiry I found that these stains were caused by matter vomited that morning. Dr. O. did not test the urine, and I was unable to obtain a specimen, the child dying a few hours later. On October 10 the wife of Sergeant Weaver was taken ill. Dr. O. gives me notes up to October 13. He saw her a few hours after the initial chill, and found her temperature 104°; pulse 130; tongue rather red; gums normal. She complained of headache and pain in the "small of her back." He did not keep a record of her temperature, but says it commenced to decline on the second and was normal on the third day. On October 13 I found her in the following condition: temperature 98°; pulse 30, and very weak. Skin very yellow and covered with a sour-smelling sweat. Her face was livid, and her eyes jaundiced, staring, and glassy; tongue narrow, thick, and pointed, with dark coating in patches near the base, and very red elsewhere; gums soft and spongy. At short intervals she ejected small quantities of black vomit. Dr. O. says that she commenced this vomiting the day before. I was unable to obtain a specimen of her urine, as she died about four hours after I saw her, without having passed any.

On October 13, Lizzie Carey (age 15 years, native of Key West) was taken ill with a severe chill. I saw her half an hour later; she then complained of headache and severe lumbar pains. Skin hot and dry; face flushed and eyes congested; tongue slightly coated, and where not coated very red; temperature 102.5°; pulse 118; urine abundant, light in color, and free of albumen, specific gravity 1004. At 4 o'clock her condition was about the same, with a slight increase of the lumbar pain. Temperature 103.6°; pulse 118; urine normal. October 14, 9 a. m.: temperature 102.8°; pulse 108; conjunctiva much injected; eyes glassy; tongue small, more coated, and furred at tip. Specific gravity of urine 1012; no albumen. At 4 p. m. her temperature was 103°; pulse 100. October 15 at 8 o'clock a. m., her temperature had fallen to 101°; pulse 80. She complained of nausea, and eyes were slightly jaundice. Urine scanty; specific gravity 1018; no albumen.

Leaving Key West at 10 o'clock a. m., October 15, I was unable to get further notes in this case. This case and the two I saw at the barracks are, in my opinion, cases of genuine yellow fever. The physicians of Key West are almost unanimous in the opinion that the case of McClintock and those which occurred at the barracks

were cases of yellow fever, but claim that McC.'s was the first case occurring this summer. This granted, it is necessary to admit that the fever originated in Key West. On the other hand, however, it is certain that a pernicious fever had been prevailing for several months before McClintock was taken ill.

But two facts will attract attention: First, that the house where McClintock was taken ill, and the barracks, where the next acknowledged cases occurred, are quite a distance apart. Secondly, that both are in the region where the "congestive fever" had been raging for the last three months. Just as I was leaving Key West four new cases were reported, one of them at the barracks. I left Key West October 15, at 10 o'clock a. m.

CLOSING OF INSPECTION STATIONS.

Dr. R. W. Mitchell, member of the National Board of Health, announces under date of October 18 that inspections at New Orleans were suspended on the 15th, and the station below Vicksburg was closed at the same time.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—Reports from United States Consul W. E. Goldsborough to August 28 state that the usual dysenteric and malarial diseases of the summer prevail, but no epidemic or contagious diseases are noted.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports 76 deaths in Bridgetown during the month of August, being at the annual rate of 15.6 per 1,000. Mean temperature, 83°; general sanitary condition, good.

BELIZE, HONDURAS.—The report for the week ending August 28 shows only one death in a population of 4,000. The report of the public hospital for the month of August gives 11 patients remaining August 1, 22 admitted in August, 1 death, 22 discharged, and 10 remaining August 31.

BUENOS AYRES.—United States Consul E. L. Baker, under date of August 23, states that his collection of statistics for reports has been interrupted by the civil war, and the city is still under martial law. This state of affairs, with a close siege by land and a rigid blockade of the port, has led to almost entire neglect of sanitary matters, and the city is now in a deplorable condition. The public health has for the past six months been very good, but with the approach of warm weather, in the present foul condition of the streets, there is much reason to fear an epidemic of yellow fever. Small-pox prevailed extensively in June and July, but is now disappearing, and the cases occurring are milder in type.

COLON, ASPINWALL.—United States Consul J. Thorington, under date of September 25, reports that "Chagres fever" and other malarial diseases prevail. There are but two seasons—the wet, from May till near the end of December, when land breezes prevail; during the dry season the trade-winds blow, and there is less sickness, but the climate is debilitating at all times. Some improvement has been made recently in the drainage and cleanliness of the town. The population is about 3,000. The death-rate by the last report was only 16 per 1,000 per annum, but being only for one week, it gives no indication of the annual rate.

CONSTANTINOPLE.—The Bulletin Sanitaire of September 14, forwarded by United States Consul G. H. Heap, reports a general decrease of typhoid and typhus fevers in the Turkish provinces.

FLUSHING, NETHERLANDS.—United States Consul P. Smith, under date of September 30, states that during the months of August and September "a few people died of ordinary sickness," but there is so little sickness that the apothecaries are taking a general vacation in the absence of business. The military surgeon reports the same healthy condition among the troops in garrison, only seven cases of slight sickness occurring in three weeks among 760 men.

FOOCHOW, CHINA.—Advices from United States Consul J. C. Wingate to August 21 report no change in the sanitary condition of the place.

GONAIVES, HAYTI.—The report for 14 weeks ending August 21 shows a total of 41 deaths; population and death-rate not noted. The causes are not given, but it is stated that no case of contagious or infectious disease has been observed.

HAVANA, CUBA.—During the week ending October 15 there were 12 deaths from yellow fever, and the number of cases in the city at that date is supposed to be at least 45. Four vessels in the harbor are known to have one or more of their crews sick with the fever, either on board or ashore. Since October 1 the number of fatal cases of "pernicious fever" has increased to a suspicious degree. The Spanish bark *America*, which sailed for New Orleans October 10, and the Spanish bark *VII de Noviembre*, which sailed for Charleston, S. C., October 14, are believed to have had yellow fever on board while in port. There were 15 deaths from small-pox during the week.

LONDONDERRY, IRELAND.—United States Consul A. Livermore, under date of October 7, states that his sanitary reports are founded only upon the published statements of the public institutions, as the reports of private practice are not furnished to him. No applications are now made at the United States consulate for bills of health by masters of vessels sailing for ports in the United States.

MALTA AND GOZO.—During the five weeks ending September 15 there were 350 deaths from all causes in a population of 154,830, giving an annual death-rate of 23.6 per 1,000. No scarlet fever is reported, and only 1 death each from measles and diphtheria. Among the principal causes of death were: Diarrhœal diseases, 78, of which 12 were dysentery; consumption, 19; other lung diseases, 14; heart disease, 14; typhoid fever, 10, and old age, 15.

MOSCOW, RUSSIA.—United States Consul A. Weber reports, during the month of July, 4 deaths from cholera, 8 from small-pox, and 95 from typhoid fever. Diseases of the lungs caused 297 deaths and diarrhœal diseases 1,050. The total of deaths during the month was 2,469, and the population being taken at 601,970, the annual death-rate was 48.3 per 1,000. Mean temperature, 68°.

NINGPO, CHINA.—United States Consul E. C. Lord sends reports to September 4. Typhoid fever is the only contagious disease noted, but the extent of its prevalence cannot be learned.

PUERTO CABELLO, VENEZUELA.—United States Consul A. Lacombe, under date of September 4, states that no yellow fever has existed in that port since 1868. Near the close of 1879, two vessels with cargoes of beef from Buenos Ayres had a few cases on board while in port, but, owing to precautions taken, the port was not infected. The consul incloses a certificate from General I. F. Mora, chief of the department and president of the board of health. This certifies that no epidemic or contagious disease has existed for several years at Puerto Cabello, and that clean bills of health have been regularly given. The statement is certified by the consuls of Spain and Germany.

QUEENSLAND, AUSTRALIA.—The report for July from Brisbane district gives the population of the town and suburbs as 33,884. There were 99 births, being at an annual rate of 50.8 per 1,000; deaths, 35; annual rate, 18 per 1,000. Ten of the deaths were under 5 years. Mean temperature, 61°; prevailing winds, southwest.

SABANILLA, UNITED STATES OF COLOMBIA.—United States Consul E. P. Pellet reports, under date of September 4, that no cases of yellow fever have occurred at Baranquilla since August 18. The cases which have occurred have all been among foreigners, and nearly all have proved fatal. Those who are not compelled to visit that country during the season of danger should wait until December, as they come at the risk of their lives in the summer and fall.

SANTA CRUZ, PALMA, CANARIES.—United States Consul F. W. Lavers reports 16 deaths during the month of August in a population of 6,070; annual death-rate, 31.3 per 1,000. Causes of death not stated.

SINGAPORE.—United States Consul A. G. Studer reports his district free from contagious or infectious diseases up to September 13, 1880.

SYDNEY, AUSTRALIA.—The report for the city and suburbs for the month of July gives a total of 336 deaths in a population of 136,483, making the annual death-rate 29.5 per 1,000. The births during the month were 720, being at an annual rate of 63.3 per 1,000. This would indicate a remarkable natural increase, and the population has probably been largely increased by immigration; yet the reports are still based on the census of 1871, and the above rates must be greatly in error.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

JAPAN.—The report of Dr. T. H. Streets, U. S. N., for August notes 4 cases of choleraic diarrhœa, 3 of typhoid fever, and 4 of other contagious diseases in Yokohama. There were 2 deaths from typhoid fever, and 166 from causes not stated.

PENSACOLA, FLA.—The president of the board of health, S. C. Cobb, forwards under date of October 17 the sanitary history of two vessels sailing from Havana for Pensacola and New Orleans:

1. The British bark *Prince Rupert*, bound for New Orleans, has the following notes on her bill of health given by H. C. Hall, United States consul at Havana, September 25; vessel last from Liverpool with coal. In September, 1879, had yellow fever on board at Havana, and her captain died of it. This time six of her crew have been sent

to hospital, but the physicians there state that none of them have yellow fever, and none have died. The vessel has remained in the open bay, and her sanitary condition is considered good. Was fumigated September 24 with 100 pounds of sulphur, and solution of sulphate of iron and carbolic acid freely used in the bilges, &c. Ballast of white stone, in good condition; no cargo. Crew of 21 men and one passenger: all well at time of sailing. The sanitary condition of the port (Havana) is noted as "bad in the city and at and near the wharves." For the week ending September 25 sixteen deaths from yellow fever and ten from small-pox are reported.

2. The Spanish brig *Maria Elisa*, bound for Pensacola, has the following notes on her bill of health from Consul H. C. Hall, October 11: Vessel last from Ship Island with lumber. No reliable account of her previous to this voyage. Arrived at Havana September 15, and was unloading for 18 days at a suspected wharf; was six days in the open bay before sailing. No sickness known to have occurred on board while in port. The same measures for purification were used as in the *Prince Rupert*. Vessel in ballast of bluestone; no cargo. Crew of 9 men all well October 11; seven of them have had yellow fever in former years. For the week ending October 9 fourteen deaths from yellow fever and four from small-pox are reported.

VICKSBURG, MISS., October 23.—Dr. W. T. Balfour reports that three cases of scarlet fever occurred in one family, between September 29 and October 3. A case also was reported October 10 in a family two doors from the first. The source of contagion was unknown, but it may have been from New Orleans or Natchez. No new cases are reported since October 4, and those mentioned all recovered. The city is very healthy, and two premature births constitute the total mortality for the week ending October 23.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—After August 28, the reports from hospitals in the United States will be published every four weeks in a table giving the totals for that period. Only those hospitals sending reports for the four weeks will be represented in the table.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

* Figures omitted in the report.

NOTES.

NEW HAVEN, CONN.—For September: Mean temperature, 64°.3; maximum, 72°; minimum, 57°; mean humidity, 79; prevailing winds, south; rain on 7 days; rainfall 3.73 inches.

BURLINGTON, VT.—July: Still-births, 2; births, 18; marriages, 4; mean temperature, 71°.7; mean humidity, 62; rainfall, 2.3 inches.

BURLINGTON, VT.—August: Births, 23; marriages, 9; mean temperature, 68°.4; mean humidity, 62.7; rainfall, 2.26 inches.

BURLINGTON, VT.—September: Still-birth, 1; births, 25; marriages, 5; mean temperature, 62°.9; mean humidity, 68.6; rainfall, 3.26 inches.

HUDSON COUNTY, N. J.—July: Births, 249; marriages, 79; still-births, 29.

HUDSON COUNTY, N. J.—August: Births, 227; marriages, 83; still-births, 26.

HUDSON COUNTY, N. J.—September: Births, 300; marriages, 176; still-births, 28.

WILMINGTON, DEL.—September: White population, 38,000; deaths, 47; annual rate, 14.8 per 1,000. Colored population, 6,000; deaths, 18; annual rate, 36.0 per 1,000.

SCRANTON, PA.—August: Births, 54; marriages, 12.

SCRANTON, PA.—September: Births, 62; still-born, 1; marriages, 13.

DISTRICT OF COLUMBIA.—July: Deaths, white, 192; annual rate, 19.2 per 1,000; colored, 179; annual rate, 35.8 per 1,000; births reported, 187 white; annual rate, 18.7; 150 colored; annual rate, 30 per 1,000; still-births, 23: white, 10; colored, 12; unknown, 1. Marriages reported, 29 white, 23 colored. Highest temperature, 98°; lowest, 59°; mean, 77°.2; prevailing winds, northwest; mean humidity, 65; rain on 14 days: rainfall, 2.25 inches.

DISTRICT OF COLUMBIA.—August: Deaths, white, 154; annual rate, 15.4 per 1,000; colored, 171; annual rate, 34.2 per 1,000: births reported, 173 white; annual rate, 17.3; colored, 137; annual rate, 27.4 per 1,000; still-births, 28: white, 6; colored, 22. Marriages reported, 37 white, 17 colored. Highest temperature, 95°; lowest, 59°; mean, 75°; prevailing winds, south; mean humidity, 70.8; rain on 14 days; rainfall, 3.83 inches.

NORFOLK, VA.—August: Deaths, 24 white; annual rate, 19.3 per 1,000; colored, 36; annual rate, 38.2 per 1,000. Mean temperature, 76°.8; highest, 95°; lowest, 62°; mean humidity, 73.8; prevailing winds, southwest; rainfall, 9.9 inches. The deaths under 5 years were 8 white and 24 colored; annual rates, 6.5 white, 25.5 colored.

NORFOLK, VA.—September: Deaths, 31 white; annual rate, 24.9; colored, 31; annual rate, 32.9 per 1,000. Mean temperature, 71°.3; highest, 96°; lowest, 54°; mean humidity, 70.4; prevailing winds, southwest; rainfall, 4.07 inches. The deaths under 5 years were 9 white and 17 colored; annual rates, 7.3 white, 26.9 colored.

PETERSBURG, VA.—September: Population, 10,000 white, 12,000 colored; deaths, 20 white; rate, 24 per 1,000; colored, 52; rate, 53.6 per 1,000; deaths under 5 years, 7 white; annual rate, 8.4 per 1,000; colored 25; annual rate, 25 per 1,000; Still-births 6: all colored.

PETERSBURG, VA.—October: Deaths, 22 white: annual rate, 26.4. colored, 38; annual rate, 38 per 1,000; deaths under 5 years; white, 8; annual rate, 9.6; colored, 21; annual rate, 21 per 1,000.

MOBILE, ALA.—July: Deaths, 35 white; annual rate, 15 per 1,000; colored, 47; annual rate, 47 per 1,000; still-births, 8: all colored; mean temperature, 80°; mean humidity, 76.7; prevailing winds, north; rainfall, 4.9 inches.

MOBILE, ALA.—August: Deaths, 29 white; annual rate, 12.4; colored, 48; annual rate, 48 per 1,000: still-births, 5: white, 1; colored, 4; mean temperature, 80°.3; mean humidity, 79.6; prevailing winds, north: rainfall, 4.7 inches.

SELMA, ALA.—September: Deaths, white, 5; annual rate, 17.5; colored, 9; annual rate, 26.4 per 1,000; births, white, 16; colored, 19; deaths under 5 years, 3 white, 7 colored; population, 3,425 white, 4,080 colored.

NASHVILLE, TENN.—September: Deaths, 35 white: annual rate, 15.0: colored 32; annual rate, 24.5 per 1,000: still births, 5: white, 1, colored 4; mean temperature, 68°.2: mean humidity, 72.9: prevailing winds, northwest; rain on 13 days; rainfall, 5.4 inches.

WHEELING, W. VA.—September: 1 still-birth; 3 premature births.

COLUMBUS, OHIO.—Still-births, 2.

CHICAGO, ILL.—September: Mean temperature, 63°; mean humidity, 67; prevailing winds, southwest; rain on 18 days; rainfall, 2.25 inches.

MILWAUKEE, WIS.—August: Highest temperature, 91°; lowest, 51°; prevailing winds, southeast; rain on 14 days; rainfall, 3.54 inches; still-births 10; premature, 1.

MILWAUKEE, WIS.—September: Highest temperature, 85°; lowest, 35°; prevailing winds, southwest: rain on 12 days; rainfall, 1.85 inches.

SAINT PAUL, MINN.—August: Mean temperature, 69.5: prevailing winds, northwest; rain on 12 days; rainfall, 2.6 inches.

KEOKUK, IOWA.—September: Mean temperature, 66.3; prevailing winds, south; rain on 7 days: rainfall, 3.2 inches.

OAKLAND, CAL.—August: Mean temperature, 59°.6; mean humidity, 86: no rain; births reported, 63; marriages, 30; of the pupils in public schools, 4.3 per cent. were reported sick during the month.

OAKLAND, CAL.—September: Mean temperature, 58°.2; mean humidity, 87; no rain.

THE INTERNATIONAL SANITARY CONFERENCE.

The honorable Secretary of State forwards to the National Board of Health notes accepting the invitation to the International Sanitary Conference to be held in Washington on the first day of January, 1881, on the part of the following governments:

Spain will be represented by Señor Mendez de Vigo, minister to the United States, and by a medical officer not yet appointed.

France will appoint delegates, but they are not yet named.

Venezuela accepts the invitation, but the delegates are not yet appointed.

Mexico will be represented by Señor Don Juan Navarro and Señor Don Ignacio Alvarado, as previously stated in the BULLETIN.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

ALEXANDRIA, EGYPT.—Dr. Neroutsos Bey, President of the General Board of Health of Egypt, under date of October 14, reports that the general sanitary condition of Egypt has been very satisfactory of late, with the exception of an epidemic of *dengue* fever which began in Cairo and soon spread over the whole country. In Cairo more than half of the population were attacked, but the mortality was small. It is worthy of note that the same fever prevailed over the whole southeastern portion of the United States at the same time.

HAVANA, CUBA.—During the week ending October 22, there were 18 deaths from yellow fever, 2 of which were from the American bark *R. A. Allen*. There are about 35 cases in the city at present. It is believed that the Spanish bark *Teresa Figueras*, which has cleared for Savannah, Ga., had yellow fever on board while in the port of Havana.

MONROE, MICH.—Dr. A. J. Sawyer reports 14 deaths, for the six months ending July 31, in a population of 5,000. Annual rate, 5.6 per 1,000. The causes of death were: diphtheria 3, scarlet fever 2, pneumonia 3, consumption 6.

PHILADELPHIA, PA.—Dr. R. A. Cleeman, health officer, sends the following report for the third quarter of 1880:

The climate of Philadelphia during the third quarter of 1880 presented, for the most part, its ordinary characteristics. There was no uncommon degree of heat nor of cold, neither of dryness or moisture, nor excess nor deficiency of rainfall. The mean temperature, calculated from the monthly averages furnished at the United States signal station in this city, was 72.1° F., mean humidity 67° (saturation = 100°), and the rainfall 13.93 inches. Yet the temperature was more equable than usual, since July and August, with mean temperatures respectively of 75.6° F. and 72.8° F., were each about 1 degree cooler than common, while September, registering 67.7° F., was nearly two degrees warmer than its average. The rainfall was distributed somewhat differently from the averages in the several months, 7.74 inches of rain falling in July against the average, 5.22 inches, and only 1.10 inches in September against 3.39 inches. The precipitation in August, 5.09 inches, was about the average. These meteorological features suggest nothing exceptional for the death rate of the city, since they are those to which the majority of the inhabitants of Philadelphia have become acclimated.

The total number of deaths recorded during the quarter (thirteen weeks, July 4—October 3) was 4,451, divided among the several months as follows: July (four weeks) 1,741; August (four weeks) 1,304; September (five weeks) 1,406. The aggregate does not include the deaths of those prematurely born (29) and the still-born (65). This mortality is equal to an annual death rate of 21.07 deaths to each thousand inhabitants living, the population of Philadelphia being 854,542, according to the figures of the late United States Census as published informally. The rate is not unfavorable, especially when it is considered that the third quarter of the year in Philadelphia is generally the most sickly of all the quarters, this period being responsible, as a rule, for about thirty per cent. of the total mortality of the year. It will be remembered, however, that the death rate of the previous quarter (the second) this year was higher than usual, the number of deaths recorded for it having been 4,672, or more even than have occurred in the quarter now under consideration. I accounted for the unusual mortality (BULLETIN of August 7, 1880) by the earlier advent of the summer weather this year, and when considering the mortality from cholera infantum, on which the excess of deaths chiefly depended, I suggested that as we might expect the hot season to close sooner than usual and the deaths from this disease, which are so closely connected in their increase with a high temperature, to be curtailed in number, so the whole summer might not be behind others in healthfulness—a state of things actually attained, as the lowered death-rate of the third quarter now indicates.

The deaths of males exceeded those of females, 2,324 of the former dying to 2,127 of the latter.

The mortality was divided among the several ages as follows: Under one year, 1,305; between one and two years, 400; between two and five years, 249; between five and ten years, 128; between ten and fifteen years, 107; between fifteen and twenty years, 132; between twenty and thirty years, 401; between thirty and forty years, 350; between forty and fifty years, 336; between fifty and sixty years, 307; between sixty and seventy years, 305; between seventy and eighty years, 259; and beyond eighty years, 172. A greater proportion of children, it appears, perished before the second year of life was ended than is found in the annual death rate for this period of life in Philadelphia, while the ages from two to five years had, in a similar comparison, a lessened mortality. The first result is due to the prevalence of cholera infantum, the deaths from which are virtually limited to children in their first and second years, especially to those less than a year old; and the other, in great degree, to the marked decline which will be pointed out below, in scarlatina, diphtheria and croup, diseases which are most fatal to children between two and five years of age.

In the following list of causes of death, arranged after the manner of Dr. Farr, the number of deaths from each cause will be found.

I. ZYMOTIC DISEASES 1,170, including *miasmatic diseases* 1,141 (smallpox 50, scarlatina 48, diphtheria 51, croup 42, whooping cough 26, typhoid fever 151, typhus fever 5, erysipelas 4, puerperal fever 2, dysentery 64, diarrhœa 58, cholera infantum 528, cholera morbus 46, malarial fevers 21, rheumatism 7, cerebro-spinal meningitis 11, other miasmatic diseases 27); *enthetic diseases* 6; *dietic diseases* 20; *parasitic diseases*, 3.

II. CONSTITUTIONAL DISEASES 1,078, including *diathetic diseases* 145 (cancer 81, other diathetic diseases 64); *tubercular diseases* 933 (tabes mesenterica 319, phthisis pulmonum 569, other tubercular diseases 54).

III. LOCAL DISEASES 1,563, including *diseases of the nervous system* 715 (cephalitis 248, apoplexy 69, paralysis 98, convulsions 187, sunstroke 14, tetanus 39, other diseases of the nervous system 60); *dis-*

cases of organs of the circulation 184 (pericarditis 23, aneurism 5, heart diseases 141, other diseases of organs of circulation 9); *diseases of respiratory organs* 224 (bronchitis 56, pleurisy 7, pneumonia 131, other diseases of the respiratory organs 30); *diseases of the digestive organs* 317 (enteritis 157, peritonitis 37, intestine diseases 34, stomach diseases 2, liver diseases 79, other diseases of the digestive organs 8); *diseases of the urinary organs* 109 (nephritis 17, Bright's disease 52, other diseases of the urinary organs 40); *diseases of the generative organs* 7 (diseases of ovaries 2, uterus diseases 5); *diseases of organs of locomotion* 6 (caries and necrosis 3, joint disease 3); *diseases of the integumentary system* 4.

IV. DEVELOPMENTAL DISEASES 438, including *developmental diseases of children* 34, (malformations 21, teething 13); *developmental diseases of adults* 9 (childbirth 2, puerperal convulsions 7); *developmental diseases of old people* 138 (old age 138); *diseases of nutrition* 257 (debility 136, inanition 121).

V VIOLENT DEATHS 196, including *accident or negligence* 180 (drowning 51, otherwise 129), *homicide* 3, *suicide* 13.

CAUSES NOT SPECIFIED, 6. Total, 4,451.

The whole number of deaths in the quarter was, as I have already mentioned, less than that in the previous three months. The exact difference was 221 deaths, yet in the third quarter the 1,170 deaths from zymotic diseases exceeded by 190 those in this class for the second quarter, the better showing for the total in the quarter now under examination being due to a decrease in the class of local diseases from 1,924 to 1,563, a falling off of 361.

In the zymotic class the increase was chiefly due to an augmented number of deaths from cholera infantum, an advance to 528 from 329, a difference of 179; but the deaths from the other diarrhœal diseases by typhoid fever, dysentery, diarrhœa, cholera morbus, also multiplied in number, as well as those from the malarial fevers and small-pox. On the other hand, measles disappeared from the list of the causes of death, and scarlatina, diphtheria, croup, cerebro-spinal meningitis, erysipelas, puerperal fever, with some allied diseases, had a greatly lessened mortality. It is interesting to note how the diseases above have grouped themselves together to suggest to us, as it were, the parallelism, or otherwise, of the conditions of their causation. Typhoid fever and malarial fevers being in company may lead us to recall the words of the distinguished president of the Epidermiological Society of London* when he places climatic conditions as a cause for enteric fever, even irrespective of filth. How important such conditions are in Philadelphia may be learned from the statistics of the health office, from which I have elsewhere† shown that the mortality annually culminates here in August with quite fixed variations in other months, a regularity which, though not inconsistent indeed with the idea that emanations from filth are the only cause of typhoid fever, still favors caution in accepting too exclusively this dogma.

The greater number of deaths from small-pox is a disagreeable fact. The mortality from this disease was decreasing till, in the month of July, it had diminished to four deaths; the number of deaths increased to thirteen in August, and then in September so many as thirty-three were counted, twice the mortality which occurred in February, the month responsible up to that time for the greatest number of deaths since the invasion of the disease in the previous November. With the recollection that the disastrous epidemic of 1871–1872 had its first mutterings in Philadelphia during the third quarter of the year, and burst suddenly into a fury in the fourth quarter, analogy may give rise to some gloomy speculations as to the future of this present examination of the zymotic, though small-pox has not as yet been shown to bear a fixed relation to the seasons like the other diseases with which it has been grouped above. The much greater proportion of the deaths from this disease belong to the south-eastern portion of the city, especially to the fourth ward, a district populated, in the density of 100,000 inhabitants to the square mile, by the most degraded portion of the community. This region lies at a distance of nearly four miles from the section in which small-pox first appeared, the whole intervening space, the heart of the city, which is closely built up, having so far escaped with but very few deaths. It seems probable that the ignorance and recklessness of the people in the district now invaded have invited the disease through carelessness in vaccination, and that the exemption of the other portions of the city is due to the more thorough use of this precious prophylactic.

The vaccine physicians of the board have been vaccinating with so much zeal that the appropriation to pay them has become exhausted, but an appeal has been made to the city council for more funds, which has been favorably reported upon by the finance committee, and will, without doubt, be answered with a new appropriation. Fully armed, then, we hope to wage again successful war against the enemy.

In my letter of February 28, discussing the mortality from typhoid fever during the last quarter of 1879, I called attention to some anomalies in the distribution of the deaths among the several months, which, notwithstanding that the whole mortality from the disease was not above the average for that period of the year, yet seemed to me to foretell a probable increase beyond the average in the number of deaths from the fever at the close of the following summer should the winter succeeding be mild. The winter was not severe, the spring unusually warm, and the result as anticipated, though the moderate heat of the summer and the heavy rain-fall of July doubtless made the disease less marked. The 151 deaths from the disease—40 in July, 65 in August, and 46 in September—are in number about fifty per cent. greater than the average mortality from typhoid fever in this quarter for the ten years preceding 1876. In the last-mentioned year 279 perished from the disease in the third quarter: in 1877 a lesser number, 177; in 1878 still less, 120; and in 1879 so few as 82; so that until this year there had been a steady decline since the year 1876. I am not aware that there has been any less done towards keeping the city clean than in the previous two years nor that the drinking water is more impure: hence I am inclined to attribute the entire increase to the climatic causes already spoken of as operative in the previous year and succeeding winter. Yet I would not for a moment relax in the warfare against filth, since we cannot ignore the instances in which this has been logically shown to be the determining agent of the disease. There is no difficulty in imagining that while the poison may find a congenial nidus in filth yet that it may flourish elsewhere, and that it develops more freely under favorable climatic conditions.

The deaths from cholera infantum, 528, though greater in number, as we have seen, than in the previous quarter, are considerably less numerous than those reported during the corresponding quarter of the previous year, as was rightly conjectured from the increased mortality in the second quarter of this year. Adding together the deaths from the disease in the first and second quarters of 1880, the total appears not much different from that for a similar period in the previous year, one in which the mortality from cholera infantum was below the average.

The increase in the number of deaths from dysentery, diarrhœa, cholera morbus and malarial fevers over the preceding quarter was from 19, 30, 22, and 6, to 64, 58, 46, and 21 respectively. The differences are marked, and such as experience has taught us to expect with the advancing summer, but they are not of sufficient intrinsic value to give these diseases permanent places in the death-list.

Scarlatina, as foreshadowed in a previous letter, declined in the number of its deaths, the diminution being as great as from 88 to 48 deaths, while diphtheria and croup each felt the influence of the season in a certain degree, there being 51 deaths from the former in the quarter, to 72 in the second quarter, and 42 from the latter to 62. The deaths from erysipelas were only 4 where they had been 18 in the previous quarter, and those from puerperal fever were but 2 where they had been 10. The better ventilation of houses from the constantly open windows and doors during the warm season must have its effect in scaling down the mortality from the above zymotics.

The great falling off in the number of deaths in the large class of local diseases, already alluded to, was due for the most part to the diseases usual in the mild season, in the mortality from bronchitis and pneumonia in the order of diseases of the respiratory system; from the two diseases combined there were 187 deaths in the third quarter, while there had been as many as 419 deaths from the same causes in the quarter preceding. It is worth while to call attention to the number of deaths reported from tetanus in the order of diseases of the nervous system. From this cause there were 39 deaths during the quarter, 29 of which occurred in July, in strong contrast to the mortality in the corresponding quarter of each of the previous three years, which was respectively 9, 4, and 13. The average annual mortality for the previous ten years from tetanus did not equal so large a number as this portion of a year has furnished, having been but 31. The reasons of the increase have not yet been thoroughly investigated. It is significant, however, that the large majority of the deaths took place in July, the month in which the celebration of the nation's birthday gives rise to the explosion of a good deal of gunpowder, and that the wounds which were followed by tetanus are known to have been caused in a great number of instances by the discharge of a toy pistol called the "climax." This miniature weapon is supplied with a blank cartridge composed of a metal cap, rifle powder containing a fulminate of mercury, and a pasteboard wad. I saw a young girl whose finger was bruised by the wad, and who died, I was informed subsequently, of tetanus. It seems thus probable that meteorological conditions were not especially in fault, as is often the case, in determining the increased mortality, but the greater number or character of the wounds made by this pistol was the disturbing element. The obvious inference is that a restriction should be placed upon the sale of so dangerous a plaything to children.

PERU, IND.—Dr. John H. Helm, president of the board of health, reports for the quarter ending September 30 a total of 39 deaths. The causes noted were: diarrhœal diseases 11, consumption 2, other lung diseases 3, measles 1, puerperal 2, malarial fever 1, and 2 from accidents.

WACO, TEX.—Dr. H. W. Brown reports, under date of October 26, that the town and vicinity have been quite free from epidemic diseases, and that the dry weather lately prevailing has been favorable to the health of the people.

Rock Island, Ill., 12,000; deaths, 5; under 5 years, 3; croup 1; malarial fever 1; scarlet fever 1. Rockland, Me., deaths, 2; consumption 1. Shelbyville, Tenn., 1,913; deaths, 3; under 5 years, 2; consumption 1; croup 1. Starkville, Miss., 1,454; death, 1; consumption 1. Steubenville, Ohio, 13,500; death, 2; under 5 years, 1. Summit, Miss., 1,808; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 3; under 5 years, 2; diphtheria 1. Winchester, Va., 5,000; deaths, 2; under 5 years, 1; consumption 1; croup 1. Winona, Minn., 10,000; death, 1. Youngstown, Ohio, 15,089; deaths, 3; under 5 years, 1; consumption 1; diarrhœa 1. Total population, 297,301; deaths under 5 years, 36; total deaths, 93; annual rate per 1,000, 16.3.

MISCELLANEOUS.

The letter of Dr. Neroutsos Bey, from Alexandria, Egypt, published in this number of the BULLETIN, reports the extensive prevalence of *dengue* fever in Northern Egypt. This region corresponds in geographical latitude with the Gulf coast of the Southern United States, where the same fever has prevailed. The isothermal difference is about 10 degrees. United States consuls located on the belt of latitude between 28° and 35° north are requested to note and report the occurrence of the *dengue* fever in any other countries.

INSPECTORS' REPORTS.

LA SOMA, MEXICO.—Dr. C. B. Combe, inspector for the National Board of Health, reports, under date of October 15, that all quarantine restrictions were removed at that date at the port of Bagdad, Mexico.

MINSTER, OHIO.—Dr. E. F. Wells sends the following report under date of October 20:

The health of this town and surrounding country is exceptionally good. This section of Ohio having since its settlement been annually scourged by malarial fevers has been comparatively exempt from the *intermittent* forms for the past three years, and in their stead has appeared remittent, typho-malarial, and typhoid fevers, as has ever been the case in the West with the *cessation* of clearing off forests and exposing virgin soil to the air by plowing, ditching, &c. During the past two months I have met with a few cases of typhoid fever and typho-malarial fever, as well as with remittents partaking of the typhous nature. A few cases of these have presented a peculiar tenderness of the *colon* in addition to the usual ileo-cæcal symptoms. Along the southeast bank of the reservoir erysipelas is prevailing to a limited extent, and in the vicinity of St. John, Mercer County, 6 miles west from here puerperal fevers have prevailed for more than a year. I have not been able to trace any connection between the erysipelas and child-bed fevers.

There occurred in this place one fatal case of diphtheria, on October 26, and a single fatal case nine miles west of here.

GUADALOUPE, WEST INDIES.—United States Consul S. F. Colardeau, under date of October 8, reports that there has been no case of yellow fever at Pointe à Pitre since his last advices. The troops are still kept in their mountain quarters, as the low lands are not yet considered safe.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, NOVEMBER 13, 1880. [No. 20.

MONTHLY REVIEW OF MORTALITY FOR OCTOBER, 1880.

The average population represented in the weekly reports for the five weeks from September 25 to October 30 is less than that for September by 182,170, and as compared with August shows a reduction of 461,963. The general death-rate of the country has fallen from 20.41 to 20.24, and has remained very near that mean for several weeks. The rate of mortality under 5 years, following the decline in diarrhœal diseases, has shown a much greater reduction; taking the means for September and October, the rate has fallen 11 per cent., but if the highest rate of last month be compared with the lowest of October, the reduction is 18 per cent.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Causes of death.—Consumption and acute lung diseases are steadily increasing, having advanced from 3.99 to 5.04 during the month, and the mean is 55 per cent. higher than that for last month, having risen from 3.95 to 4.50. In this increase consumption has gained but 5 per cent., while other lung diseases show an advance of 37 per cent. since last month. The six principal zymotic diseases have changed their mean rates as follows: *Increased*—diphtheria, from 0.89 to 1.27, or 42 per cent.; scarlet fever, from 0.29 to 0.41, or 65 per cent. *Decreased*—enteric fever from 0.56 to 0.52, or 4 per cent.; measles, from 0.06 to 0.02, or 66 per cent.; whooping-cough from 0.21 to 0.16, or 24 per cent.; and malarial fevers from 0.65 to 0.58, or 11 per cent. The aggregate of the six diseases gives a decline in mean mortality from 2.96 to 2.66, or 11 per cent., since last month. Malarial fevers have in many places assumed the "typho-malarial" type, and malarial hæmaturia has been prevalent in some Southern States. Yellow fever has not spread in any part of the United States, only one death occurring in New Orleans; and though four deaths have been reported at Key West, the fever has not extended to the mainland. Small-pox continues to increase, and the 62 deaths reported are but a part of those which have occurred.

Distribution of diseases.—The increase of only 5 per cent. in the general mortality from consumption is due to its irregular distribution this month; the rate has advanced 8 per cent. in the Northeast and 9 per cent. in the Northwest, but in the Southeast it has fallen 27 per cent. On the other hand, acute lung diseases show an increase of 45 per cent. for the Northeast section, and of 11 per cent. for each of the others. But the increase of diphtheria from a rate of 0.33 to 1.27 in the Northwest section is the movement most worthy of observation in the zymotic class of diseases; in the other sections the disease is also increasing, but to a much less extent. Croup has followed diphtheria in its steady rise; but in this disease the Northeast and Northwest show nearly equal changes, the mortality being nearly doubled in each since last month, while the increase is only 32 per cent. for the Southeast section. Scarlet fever remains stationary at 0.46 per 1,000 in the Northwest, but has advanced rapidly in New England, raising the rate of the Northeast section from 0.25 to 0.40; and in the Southeast the increase has been from 0.25 to 0.44, or 76 per cent. In this section, however, the disease is chiefly represented by the city of Baltimore, which reports at least three-fourths of the fatal cases. The downward movement of the diarrhœal diseases has been most rapid in the Northwest, where the change is from 2.63 to 1.18, or 145 per cent., since last month; the rate has fallen 60 per cent. in the Northeast and 34 per cent. in the Southeast section. Enteric fever is nearly stationary, showing a small reduction of mortality in all sections, but with a tendency to increase at the end of October. Measles have become only a nominal factor in the general mortality, only 14 deaths having been reported in the five weeks. Whooping-cough has also fallen to a very low rate, from 0.21 last month to 0.16 in October. The reduction has been in the two Northern sections only; in the Southeast the disease still prevails, and has risen from 0.37 to 0.41 per 1,000. Malarial fevers have declined rapidly in the Southeast with the first frosts, and more slowly in the two Northern sections. The reported fatal cases of small-pox have been distributed as follows: Boston, 1; New York, 2; Lansingburgh, N. Y., 1; Camden, N. J., 8; Philadelphia, 48; Chicago, 1; and San Francisco, 1. Nothing more is heard of the *dengue* fever which prevailed so extensively through the Gulf and South Atlantic States; but the disease is reported as epidemic in Lower Egypt, in the same latitudes with its visitation here. The inspection stations at New Orleans, below Vicksburg, and at Cairo, Ill., have been suspended: there is reason to believe that these stations, with the active measures of sanitation instituted at Memphis and other previously infected places, have protected the Mississippi Valley from another invasion of epidemic yellow fever.

NOTE.—The reports for the week ending October 30 from Chicago and San Francisco were received only in time for insertion in the weekly table, but not in time to be incorporated with the reports on which this review is based.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough reports, for the two weeks ending September 11, only one death among the foreign population. Dysentery and malarial fevers are the prevailing diseases, and are partly due to want of cleanliness and absence of drainage.

BORDEAUX, FRANCE.—United States Consul L. A. Price reports, for the month of September, 8 deaths from small-pox, 12 from typhoid fever, and 32 from other contagious diseases. Deaths under one year of age, 190; over 70 years, 80. Total number of deaths 476. Population, 215,140; annual death-rate, 26.9 per 1,000.

BRISTOL, ENGLAND.—The United States consul forwards the report of David Davies, medical officer of health, for the quarter ending October 2, 1880. The population of the city and county is estimated at 213,563; there were 1,777 births, giving an annual rate of 33.3 per 1,000; the deaths were 954, and the annual rate 17.9 per 1,000. Deaths under 5 years, 437, or 45.8 per cent. of the total; of these, 283, or 29.6 per cent. of all deaths, were under one year of age. Only two cases of small-pox were reported, and no deaths. Among the causes of death were, measles 3, scarlet fever 51, whooping-cough 11, enteric fever 14, diarrhœa 124, consumption 85, other lung diseases 80, diseases of the brain 57, of the heart 62, puerperal 3, violence 44. With regard to typhus fever, the health officer remarks that it has been extinguished in the city for a considerable period, "except when introduced from New York." In view of the extreme infrequency of this disease in New York, and its entire absence in most cities of the United States, together with the well-known prevalence of the disease in cities not distant from Bristol, there may be some question as to the source of contagion as stated above.

CALCUTTA.—The report of Surgeon-Major K. McLeod for the month of August gives a total of 583 births, being at an annual rate of 16.3 per 1,000. The deaths in the same period were 825; annual rate 23 per 1,000. Among the causes of death were: Cholera, 22; small-pox, 3; fevers, 295; diarrhœa, 67; accidents and injuries, 18.

DEMERARA.—United States Consul P. Figyelmesy sends reports for the city of Georgetown. In June the deaths were from, diarrhœa and dysentery, 13; malarial fever, 1; other fevers, 3; consumption, 18; diseases of nervous system, 28; of the heart, 10; of the lungs, 11; old age, 14; accidents, 6; suicide, 2. Total number of deaths, 159; population in 1871 was 34,819; on this basis the annual death-rate is 55.5 per 1,000, but this is probably too high, as no allowance is made for increase of population. In July the deaths were from diarrhœa and dysentery, 14; malarial fevers, 3; leprosy, 1; consumption, 13; other lung diseases, 8; diseases of nervous system, 18; of the heart, 11; old age, 2; accidents, 3; suicide, 1. Total number of deaths 135, being at an annual rate of 47.1 per 1,000.

FOOCHOW, CHINA.—The report of United States Consul J. C. A. Wingate, from August 21 to September 11, state that no epidemic disease has been reported during that time. Drainage and sanitary condition of the native city continue bad, as before.

GHENT, BELGIUM.—United States Consul S. Spackman reports for the month of September, one death from small-pox, 16 from typhoid fever, and 4 from scarlet fever. Among other causes were consumption 40, bronchitis 15, heart diseases 22, diarrhœa 156, chiefly among children. Total number of deaths 333; population 130,671; annual death-rate 31 per 1,000.

GUADALOUPE.—United States Consul S. Colardeau, under date of September 11, reports one death from yellow fever at Point à Pitre, from a French bark, which has been lying for some time in the harbor, waiting for a shipment of coolies returning to their native country. In a note of September 18, it is stated that the great prevalence of malarial fevers has induced the authorities to consider the subject of draining the swamps near the city, but this will probably not be soon accomplished. No fatal case of yellow fever has occurred at Point à Pitre, but cases are reported from Basseterre and other places. The exemption of the American shipping from the fever is ascribed in part to the short stay of the vessels in port.

GUAYMAS, MEXICO.—United States Consul A. Willard, in sending his report for the month of September, observes that the death of only one American citizen is noted for the month, and that was not from any contagious or climatic disease. The death-rate among children has been high, but no epidemic disease has prevailed. The report gives 23 deaths in a population of 5,000; death rate 56 per 1,000. Mean temperature 88. Of the 23 deaths, only 4 were of adults.

HONOLULU.—United States Consul F. P. Hastings reports for the month of September a total of 41 deaths, of which 3 were under 5 years of age. Of the decedents 33 were Hawaiians, 4 Chinese, 2 British, 1 Italian, and 1 American. Among the causes of death were: Consumption 7, heart-disease 4, dysentery 1, paralysis 3, dropsy 3, puerperal 1, old age 2, and suicide 1. Medical attendance was wanting in 24 cases.

JAPAN.—The report from Yokohama for the month of September shows no deaths from contagious diseases. There were 146 deaths registered, but the causes are not given.

MALTA AND GOZO.—The Government Gazette reports for the two weeks ending September 30, a total of 177 deaths, of which 107 were

under 5 years of age. Among the causes of death were small-pox 1, croup 3, typhoid fever 1, diarrhœal diseases 38, consumption 7, other lung diseases 15, of the nervous system 15, of the heart 12, puerperal 1, old age 5, accident 1. Population, 154,830; annual death-rate, 29.8 per 1,000.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton sends reports for two weeks, ending October 23. During this time it is estimated that there were 200 cases of small-pox, of which 6 died. There were 23 deaths from "other contagious diseases," and the general sanitary condition is reported as bad.

MILAN, ITALY.—United States Consul Dunham J. Crain, under date of October 9, gives the following account of disease among the agricultural inhabitants of certain parts of Italy:

Under the direction of the Italian Society of Hygiene, aided by the government, a careful investigation was made in 1879 into the causes of the steady and alarming increase of *pellagra*, a disease afflicting the laboring classes. The disease attacks the skin, brain, and muscles, destroying the powers of the body and transmitting its germs to the offspring. The report of the committee of investigation as to the extent and causes of the disease is now published.

In the year 1839 there were in Lombardy 20,282 persons having *pellagra*. The total population of the infected communes was in that year 1,446,702, which gives a proportion of 14 afflicted to each 1,000 of inhabitants. In 1856 the disease had spread to other communes of the province, so that the proportion rose to 15.7 per 1,000. In 1879 out of a total population of 26,301,154 there were 9,640,516 engaged in agriculture, or nearly 36 per cent. Of this number 97,355 were found affected with *pellagra*, or 101.5 out of every 1,000 of total population. In the afflicted provinces the area planted in Indian corn was 17.28 per cent. of the total area. The average daily wages of the agricultural laborers was 80.26⅛. The proportion of such laborers, who are affected with *pellagra* to the whole agricultural population, is 159.9 per 1,000. This disease, which was unknown to the ancients, has during the last century spread over a large portion of Europe, but prevails more especially in the northern and central provinces of Italy, where it has become permanent, assuming the character of an endemic disease.

It is stated that its first appearance was in the dukedom of Milan in the year 1770. The number of suicides caused by *pellagra* in 1874, in the northern and central provinces, was 145. The effects of the disease are shown in the military levies of the years 1878 and 1879, when, in the province of Lombardy, 20 per cent. were rejected for physical incapacity, while in the provinces where *pellagra* does not exist there were but 10 per cent. rejected.

In the *pellagra* districts the laborers live on Indian corn or maize, using no meat and few vegetables. The maize is crudely prepared in the form known as *polenta*, being rarely well cooked or salted. This restricted diet is the result of poverty, and is the generally-assigned cause of the disease; their houses are also poor.

To lessen the evils, the following measures are proposed: The amelioration of the condition of the laborers; the improvement of their habitations; diffusion of hygienic precepts; a variety of food; use of wine; prohibition of marriage among the afflicted; the letting by landed proprietors of garden-plots to laborers; the propagation of the rabbit, as affording cheap fresh food; the purification of drinking water; and an increase of wages.

While the above recommendations are good, they do not aim at the root of the evil, which is *over-population*. Measures for the encouragement of emigration from the crowded districts can alone relieve their agricultural population.

MOSCOW, RUSSIA.—United States Consul A. Weber reports for the month of August, 1,961 deaths, in an estimated population of 700,000; on this basis, the annual death-rate would be 47.1 per 1,000.

NINGPO, CHINA.—United States Consul E. C. Lord, in his reports for the two weeks ending September 18, states that malarial fevers, diarrhœa, and dysentery, are the prevailing diseases, and the summer having been more cool and damp than usual these diseases are more common than in former years.

PARA, BRAZIL.—The report of United States Consul A. C. Prindle for the month of September shows 3 deaths from yellow fever, 1 from typhus, and 1 from typhoid fever. The total for the month was 134 in a population of 40,000: annual death-rate, 55.8 per 1,000. Malarial fevers are prevalent, but no contagious disease is epidemic.

PORT AU PRINCE, HAYTI.—United States Consul John B. Terres, under date of October 22, reports that the American brig *William Robertson*, of Boston, arrived from Wilmington, N. C., on the 17th with a cargo of lumber. The crew was composed of four Chinese seamen. Three of these were sick on arrival and were placed in the hospital, where one of them died on the 19th and another on the 20th. The physicians certify the cause of death in both cases to have been gastric fever, from alcoholism. The brig will probably proceed next week to some port of Hayti to load with logwood for New York. The health of the port and shipping, excepting the above cases, is excellent.

SABANILLA, UNITED STATES OF COLOMBIA.—United States Consul W. W. Randall reports, under date of October 21, that there were at that time no cases at Baranquilla of yellow fever, small-pox, or cholera.

SINGAPORE.—United States Consul A. G. Studer reports, under date of September 18, that his district continues free from infectious or contagious diseases.

TURKS ISLAND, WEST INDIES.—United States Vice-Consul J. W. Darrell, in his report of September 25, announces the death of United States Consul Francis P. Van Wyck, who died on the 24th of remittent fever, after an illness of only three days.

YORK, ENGLAND.—The report of S. W. North, health officer, for the quarter ending September 30, gives a total of 430 births and 355 deaths. Of the latter, 7 were from scarlet fever, one from diphtheria, 5 from whooping cough, 5 from typhus and typhoid fevers, 24 from consumption, and 22 from other lung diseases. Of the decedents, 210 were under 5 years of age, and 60 were over 60 years. Birth rate, 36.7: death-rate, 30.3.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—During the week ending October 29, there were 15 deaths from yellow fever, of which 9 were among citizens and 6 in the military hospital. For the same period, 11 deaths from small-pox are reported, and the disease seems to be on the increase. The following vessels are believed to have had yellow fever on board while in port: Spanish bark *Antonia*, for New Orleans; Spanish bark Concepcion, for Savannah, and Spanish brig *Neura Saber*. During the month of October there were 63 deaths from yellow fever, and 5 deaths during the week ending November 5. The number of cases has diminished rapidly since the end of October, and November 6 it was estimated that there were not more than 20 cases in the city.

The following vessels, clearing for ports in the United States, have had yellow fever on board while in port: Spanish brigs *Lorenzo* and *Jocen Ana* and the Spanish barkentine Amazona, all for Charleston, S. C.; also, the American bark *R. A. Allen*, for Philadelphia.

Small-pox is increasing, and 16 deaths from it are reported for the week ending November 6.

KEY WEST, FLA.—A dispatch, dated November 9, states that from November 3 to November 8 ten cases of yellow fever and two deaths had been reported. Another dispatch of the same date, forwarded by Supervising Surgeon-General John B. Hamilton, of the United States Marine Hospital Service, states that another death had occurred on the night of the 8th, and that there were several cases outside of the city limits, which had not been previously reported.

NAVASOTA, TEX.—Dr. A. R. Kilpatrick sends the following reports of mortality: In September there were 8 deaths, 4 white and 4 colored. Of the whites, 1 was under five years, and died of marasmus; the deaths of the adults were, from consumption 1, congestion of the brain 1, and injury 1. Of the colored, 3 were under 8 years, one dying of malarial fever, one of "congestion," and an infant from inanition; the only adult died of dropsy.

The highest temperature was 94°, on the 1st; lowest 56°, on the 27th and 28th. Rain fell on 12 days, usually attended with thunder storms, but little wind, except on the 25th and 26th, when the wind was high, but did no damage.

In October, among the whites, one man died of miasmatic hæmaturia, and one still-birth occurred. Among the colored there were 5 deaths, one at 8 years from meningitis; of adults, one from consumption, two from diarrhœa, and one from congestion of the brain.

Highest temperature 90°, on the 12th; lowest 40°, on the 23d. Light rains fell on 4 days. The first frost was on the 16th. There was more than the usual amount of sickness during the two months. Some cases of *dengue* occurred, and pernicious fevers, with severe gastric congestion and black vomit, which proved fatal. The deaths from consumption are mostly among the colored people, and the disease is more common among them since the war, owing to their improvident habits and neglect to secure early medical attendance.

WACO, TEX.—Dr. H. W. Brown, under date of November 3, states that the health of the city and vicinity has been good during the summer, but now diarrhœa and dysentery prevail, and malarial fevers are increasing. These fevers have presented some unusual symptoms in the form of neuralgic pains, fugitive in some cases, but in others equal to those of *dengue*. The reports of mortality, being made from the list of *burials*, include many whose remains are brought from a distance, or from the surrounding country, and do not properly represent the death-rate of the city.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING OCTOBER 30, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

Rock Island, Ill., 12,000; deaths, 4; enteric fever 1. Rockland, Me., 7,500; deaths, 5; consumption 1, diarrhœa 1. Shelbyville, Tenn., 1,919; deaths, 1; consumption 1. Springfield, Ohio, 21,000; deaths, 11; under 5 years, 5; consumption 3, diphtheria 1. Starkville, Miss., 1,454; death, 1; lung disease 1. Steubenville, Ohio, 13,500; deaths, 5; under 5 years, 4. Summit, Miss., 1,808; deaths, 2; enteric fever 1, measles 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 1. Tuscaloosa, Ala., 2,000; no deaths. Winchester, Va., 5,000; deaths, 3; consumption 1, diphtheria 1. Winona, Minn., 10,000; death, 1; malarial fever 1. Youngstown, Ohio, 15,089; deaths, 2; under 5 years, 1; croup 1. Total population, 331,581; deaths under 5 years, 22; total number of deaths, 99; annual rate per 1,000, 15.6.

THE INTERNATIONAL SANITARY CONVENTION.

The Hon. Secretary of State forwards to the National Board of Health a letter dated at Tangier, Morocco, October 5, from United States Consul Felix A. Mathews, which concludes as follows:

In compliance with your request, I called the attention of the Moorish Government to the proposed conference. The Moorish minister for foreign affairs replied, that as the sanitary matters of Morocco were in the hands of the foreign representatives at Tangier, that body, acting as the board of health, will undoubtedly adhere to whatever measures the International Sanitary Conference may adopt.

As president of the Morocco board of health, I consulted the members of the board, who coincide with the views expressed by the Moorish minister for foreign affairs, the funds of the board being insufficient to appoint a delegate to attend the proposed conference.

JAPAN.—Under date of October 8, Dr. T. H. Streets, of the United States naval hospital at Yokohama, states that the general health of the country has been good during the past summer. The cholera, which had raged with more or less virulence in the Empire for three years, suddenly disappeared at the close of 1879. It is difficult to say how far this may have been due to the rigid sanitary measures of the government, or how far to other causes.

SANTA CRUZ, TENERIFFE.—United States Consul W. H. Dabney reports, for the month of September, 33 births and 38 deaths; of the latter 28 were under 5 years of age, and 3 over 70. Among the causes of death were: consumption 2, other lung diseases 2, diarrhœal diseases 6, typhoid fever 2, violence 2, old age 3.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough reports only two deaths among the foreign population during the month ending September 25. Dysentery and malarial fevers prevail among the native population, as is usual at this season of the year.

FOOCHOW, CHINA.—United States Consul J. A. Wingate reports for the three weeks ending October 2 no epidemic disease in this city, which, including its suburbs, has a population estimated at 1,100,000. The bad sanitary condition of the place has been previously described, and remains unchanged. The climate is good, and the foreigners settled there generally have good health. Mean temperature for September, 80°.

GLASGOW, SCOTLAND.—The report of the medical officer for the second quarter of 1880 gives the following statistics: In April the mean temperature was 45°.5, rainfall 3.67 inches, rain on 22 days, death-rate for all ages 26.6, death-rate under 5 years 93.9, per cent. of deaths under 5 years 49.

In May the mean temperature was 49°.2, rainfall 0.9 inch, rain on 11 days, death-rate for all ages 27.5, under 5 years 89.6, per cent. of deaths under 5 years 45.5.

In June the mean temperature was 55°.4, rainfall 2.25 inches, death-rate for all ages 23.5, under 5 years 73.5, per cent. of deaths under 5 years 41.

The total of deaths from several causes was as follows: Consumption and acute lung diseases 1,240, diseases of nervous system in children under 5 years, and premature births, 487; scarlet fever, measles, whooping-cough, croup, and diphtheria, 471; fevers 122, diarrhœal diseases 55, unclassified 1,139; total from all causes 3,484, giving a mean annual death-rate for the quarter of 26 per 1,000. The birth-rate for the same period was 39 per 1,000.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webster reports for the month of July 68 deaths in a population of 27,500, being at an annual rate of 29.1 per 1,000. Mean temperature, 48°; causes of death not stated.

LONDONDERRY, IRELAND.—United States Consul A. Livermore reports for the week ending October 23 fourteen deaths from typhus fever, which would imply a large number of cases.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports for the two weeks ending October 15 one death from small-pox and 6 from typhoid fever. Deaths from all causes 155, in a population of 154,830, not including 7,000 troops in the garrison. Annual death-rate 26.1 per 1,000. Mean temperature 74°.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer reports 413 deaths in the city and suburbs during the month of August. Population 265,000. Annual death-rate 18.3 per 1,000. Mean temperature 52°.6. Measles the only prevailing contagious disease.

NEW ZEALAND.—The report for the month of July from 15 boroughs, with an aggregate population of 130,225, gives a total of 545 births and 167 deaths. Annual birth-rate, 49.3 per 1,000; annual death-rate, 15.1. In four of the principal boroughs, having a population of 75,720, the following causes of death are noted: Diphtheria 1, croup 1, enteric fever 1, whooping-cough 1, diarrhœa and dysentery 3, cancer 3, consumption 11, diseases of nervous system 8, of the heart 11, of the lungs 20, premature births 10, puerperal 2, old age 2, accident 1. Total number of deaths, 102; annual rate, 15.9 per 1,000. Mean temperature, 47°.

During the month of August there were 511 births and 167 deaths in the 15 boroughs, giving a birth-rate of 46.1, and a death-rate of 15.1 per 1,000 per annum. In the four boroughs there were noted the following causes of death: Diphtheria 1, whooping-cough 7, enteric fever 2, diarrhœa 2, consumption 4, other lung diseases 24, of the nervous system 25, of the heart 9, premature birth 1, puerperal 2, old age 1, accidents 1. Mean temperature, 47°.6.

QUEENSLAND, AUSTRALIA.—In the district of Brisbane, having a population of 33,884, there were, during the month of August, 126 births and 40 deaths registered. Annual birth-rate 43.8; annual death-rate 13.9 per 1,000. The deaths under 5 years were 16, or 40 per cent. of the total; under one year 25 per cent. Among the cases of death were, diseases of the nervous system 4, of the heart 5, of the lungs 5, of the bowels 2, accidents 2. Mean temperature 63°.4; highest 84°.5; lowest 37°.5. Prevailing winds N. E. No rainfall during the month.

SANTA CRUZ, PALMA, CANARIES.—United States Consul F. W. Lavers reports 14 deaths during the month of September, in a population of 6,070, being at an annual rate of 22 per 1,000. No disease prevailing, and sanitary condition good.

SINGAPORE.—United States Consul A. G. Studer reports 273 deaths for the month of August; of these only 4 were Europeans. Among the causes of death were: consumption, 33; other lung diseases, 13; diarrhœa and dysentery, 40; fever, 103; leprosy, 3; dropsy, 19; accidents, 3.

SYDNEY, AUSTRALIA.—The report for the month of August, for the city and suburbs, shows 777 births and 397 deaths. The population of the city is given as 136,483 by the census of 1871, and is, therefore, probably too much in error to serve as the basis of the present death-rate. In the city there were 240 deaths, of which 83 were under 5 years. Among the causes noted were: measles, 5; scarlet fever, 1; diphtheria, 1; croup, 4; whooping-cough, 1; typhoid fever, 7; diarrhœa and dysentery, 4; rheumatism, 3; diseases of the nervous system, 26; of the heart, 19; of the lungs, 32. Mean temperature 55°.5. Rain on 2 days. Rainfall, 0.6 inches.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING NOVEMBER 6, 1880.

The following reports, for the week ending November 6, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 5; under 5 years, 1; malarial fever, 1. Allegheny, Pa., 78,000; deaths, 26; under 5 years, 8; consumption 3, diphtheria 2, enteric fever 1, scarlet fever 1, lung disease, 1. Belfast, Me., 5,308; deaths, 4; consumption 2, old age 1. Brattleboro', Vt., 6,000; deaths, 2; under 5 years, 1. Bucyrus, Ohio, 3,950; death, 1; consumption 1. Calais, Me., deaths, 3. Carrollton, Miss., 600; no deaths. Chillicothe, Ohio, 11,000; deaths, 4; lung disease 1, accident 2. Circleville, Ohio, 6,400; deaths, 2; under 5 years, 2; diphtheria 2. Clinton, Mich., 1,200; no deaths. Corinth, Miss., 2,264; death, 1; under 5 years, 1; diphtheria 1. Crystal Springs, Miss., 955; no deaths. Dallas, Tex., 10,300; deaths, 4; under 5 years, 3; consumption 1, diarrhœa 1, lung disease 1, puerperal 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Hernando, Miss., 1,000; no deaths. Helena, Mont., 3,630; deaths, 1; under 5 years, 1; diphtheria 1. Huntingdon, Tenn., 1,200; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; deaths, 2; under 5 years, 1; malarial fever 1, lung disease 1. Kenosha, Wis., 5,500; deaths, 4; under 5 years, 3; diphtheria 2, lung disease 1. Lebanon, Pa., 9,000; no deaths. Louisiana, Mo., 5,200; deaths, 3; consumption 1. Madison, Ind., deaths, 7; diphtheria 1, malarial fever 1, scarlet fever 1. Massillon, Ohio, 6,868; death, 1. Meridian, Miss., 4,013; deaths, 2. Milledgeville, Ga., 3,000; death, 1; under 5 years, 1. Monmouth, Ill., 6,000; deaths, 3; diphtheria 1, lung disease 1. Mount Pleasant, Iowa, 4,500; death, 1. Morton, Miss., 200; no deaths. Muscatine, Iowa, 8,412; deaths, 3; scarlet fever 2. Muskegon, Mich., 11,300; deaths, 3; under 5 years, 1; croup 2, diptheria 1. Nebraska City, Nebr., 5,200; deaths, 3; under 5 years, 3; croup 1, diphtheria 2. Niles, Mich., 4,200; death 1. Okolona, Miss., 2,000; no deaths. Painesville, Ohio, 5,504; death, 1. Pass Christian, Miss., 2,000; death, 1; puerperal, 1. Pearlington, Miss., 1,200; death, 1. Phœnixville, Pa., 6,692; deaths, 2; consumption 1. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; no deaths. Ripley, Miss., 1,000; death, 1; under 5 years, 1; whooping-cough 1. Rock Island, Ill., 12,000; deaths, 3; under 5 years, 2. Santa Cruz, Cal., 5,000; death, 1. Shelbyville, Tenn., 1,919; death, 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; death, 1. Summit, Miss., 1,808; deaths, 3; under 5 years, 3; diphtheria 2, malarial fever 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 2; under 5 years, 2; lung disease 1. Winchester, Va., 5,000; no deaths. Youngstown, Ohio, 15,089; deaths, 3; under 5 years, 2; consumption 1, diarrhœa 1, accident 1. Total population, 324,302; deaths under 5 years, 37; total number of deaths, 105; annual rate per 1,000, 16.9.

VICKSBURG, MISS. Under date of November 9, Dr. W. T. Balfour reports four more cases of scarlet fever, all in one family, the patients being from three to eight years of age. The residence of this family is remote from the cases reported some weeks ago; but the children last attacked attended school in a house opposite to that in which the first cases occurred. None of the cases are likely to prove fatal.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, NOVEMBER 27, 1880. [No. 22.

SANITARY SURVEY OF BILOXI, MISSISSIPPI.

Dr. A. P. Champlin, sanitary inspector for the National Board of Health at Biloxi, Miss., during the summer of 1880, submits a report on that place, in the form of the schedule of the National Board, of which report the following is an abstract:

The city of Biloxi, Harrison County, Mississippi, is situated in latitude 30° 24′ north, and longitude 88° 54′ west. It was incorporated February 18, 1850, and in 1860 the population was 804; in 1870 it was 970, and at present is estimated at 1,352, of whom about 225 are colored, 225 of foreign birth, and 852 native whites. No meteorological records have been kept, nor is there any provision for registration of births, deaths, or marriages. The city fronts on Mississippi Sound and Biloxi Bay, with some marshes near the head of the bay, and islands subject to overflow at high-tide. These marshes are not regarded as sources of malaria, the water being salt. The greatest elevation of the ground is about 25 feet above the sea level, with a general slope to the southeast, towards the Sound; on the north and east is the bay of Biloxi. The ground is undulating and broken by several ravines and valleys, which facilitate surface drainage. There is no system of underground sewerage, but the present system seems sufficient for present needs. In the fall and winter some stagnant ponds are formed near the town, and falling leaves decay in them: the exposure of the shores at low-tide does not appear to generate disease, the surface soil being generally of sand. The substratum is of clay, and no disease has ever been traced to disturbance of the surface, nor to infiltration conveyed by the ground water. The water supply is from wells and cisterns, and is abundant and pure.

The area of the city is about 3½ by 1½ miles, or 5¼ square miles, of which about one-third is covered by buildings and grounds attached. The cellars of these buildings are not liable to overflow, or intrusion of ground water, and are generally dry and clean.

The streets are from 18 to 40 feet wide, with sidewalks of 4 feet. About one mile of street surface is paved with shells; the rest is of clay, excepting some 300 feet of wooden pavement. There is no provision for cleaning or watering the streets, but their condition is generally satisfactory. No difference of healthfulness is noted with reference to the direction of the streets. Along the sidewalks are rows of mulberry, oak, and locust trees; no injurious effect has been observed from any of the trees so planted. There are no public parks. The houses are constructed without regulation by the authorities, but are generally in good condition, and have ample space around them, with facilities for bathing, and dry and clean basements and cellars. The average of four persons to a house indicates that there is no overcrowding. Inside walls are usually whitewashed; where paper is used no disease has been noted as caused by it. There is no gas used in lighting the city or houses. Garbage and refuse matters are disposed of by the occupants of houses, being burnt on the premises or buried outside of the city. This duty is mostly well performed, and back yards and cellars are kept very clean.

There is but one market-house, with 8 stalls for meats and 4 for vegetables. This is regulated by municipal ordinances, is open daily from 4 to 10 a. m., and its sanitary condition is assured by inspection. Provisions of all kinds are usually brought from the country, and the smaller animals, fowls, &c., are sold alive. No case is noted of bad meat or vegetables being offered for sale. The supply of milk is abundant and cheap. No manufacturing establishments exist in or near the city. There is but one public school, a two-story building, 60 by 24 feet, with 12 feet between the stories. The building is well lighted, and the desks, 50 in number, are placed near the windows. The water supply, provision for exercise, &c., are good, and the pupils have been free from epidemic diseases for the past four years, excepting the epidemic of yellow fever in 1878, and some *dengue* this year. Diseases of the spine, of the brain, and of the eyes are not observed among the pupils.

There is no hospital or other establishment for public charity in the city. The police inspect nuisances and perform the usual police duty, but only by day. One jail serves for prisoners of both sexes, but they are very few in number, and the cells afford ample air space. No reports are published, but no epidemic disease is known to have existed in the jail. The prisoners have good plain diet, and are not compelled to work. No houses of prostitution are known to exist in the city, and only three or four prostitutes are known as such; these are as healthy, apparently, as other women. There are five licensed sellers of liquor, and two beer-gardens. It is estimated that 7,000 gallons of beer, and 4,000 gallons of spirits are sold yearly, but there have been no arrests for intoxication within the past year, and those who drink habitually seem to enjoy as good health as those who never indulge.

The provision for burial consists of two cemeteries, one for the general use of Protestants and Catholics, the other for Jews. Both are remote from habitations, and there is no reason to suspect any contamination of the water supply from them. The graves are usually 4 feet deep, in a dry sandy soil, and the decomposition of bodies is completed in from one to two years. A few brick-lined vaults are used, but there is no receiving vault, and no special precautions are observed in interring those dying of contagious diseases. The board of health of the city has no physician nor executive health officer; it is composed of the mayor and four aldermen, who are elected by the people, and serve two years without salary. The powers of the board are derived only from city ordinances, and are ample as to right of inspection and abatement of nuisances. Small-pox cases are either strictly isolated, or removed to hospital, and the regulation on this subject is generally enforced; vaccination is not compulsory. No vital statistics are kept, and burial permits are not required. The only aid received by the city in sanitary matters has been from the National Board of Health, whose inspector has been on duty during the past summer.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

Under date of November 23, the Hon. John Hay, Assistant Secretary of State, informs the National Board of Health of the receipt of a telegram from the United States consulate at Vienna, stating that Hungary will be represented in the International Sanitary Conference to be held in Washington January 1, 1881.

ABSTRACTS FROM CONSULAR REPORTS.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports for the month of September 61 deaths in a population of 20,000, being at an annual rate of 37.2 per 1,000. There were no contagious diseases, and the sanitary condition is good. Mean temperature 83°.

FLUSHING, NETHERLANDS.—United States Consul P. Smith reports for the month of October a continuance of the remarkable exemption from disease noted in the last report from his consular district. No statement of mortality is given this month. About 12 cases of measles have occurred during the whole summer, but none have proved fatal.

GHENT, BELGIUM.—United States Consul S. Spackman reports for the month of October: typhoid fever 8 deaths, scarlet fever 1, other contagious diseases 4, consumption 46, other lung diseases 26, diarrhœal diseases 74. Total number of deaths 282; population 130,670; annual death-rate 25.4 per 1,000.

GUAYMAS, MEXICO.—United States Consul A. Willard reports for the month of October 14 deaths in a population of 5,500; annual death-rate 30 per 1,000. Mean temperature 82°. No epidemic prevails, but those who have previously had malarial fever are subject to a low fever with congestive symptoms. Two deaths from whooping-cough are all that are noted from any contagious disease.

MALTA AND GOZO.—The report of United States Consul C. B. Eynaud for the two weeks ending October 31 shows only 4 deaths from typhoid fever, and none from other contagious diseases. Total number of deaths 209; population (exclusive of 7,000 troops) 154,830; annual death-rate 35.2 per 1,000. Mean temperature 73°. The drainage of Valletta is being improved.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton reports

12 deaths from small-pox during the week ending November 6, the number of cases being estimated at 200. The total number of deaths during the week was 21; population 16,000; annual death-rate 68.4 per 1,000. Sanitary condition very bad, and small-pox is rapidly spreading over the city.

NASSAU, BAHAMAS.—The reports of United States Vice-Consul S. P. Saunders for the two weeks ending November 6 give no statement of deaths. Mean temperature 80° to 81°; physicians report the health of the city good, and the town is clean and well drained. No yellow fever has occurred for three weeks, and there are but few cases of malarial fevers, intermittent and remittent. Irregularity in sending reports is entirely due to want of communication with the United States, as explained in a note from United States Consul T. J. McLain, jr.

RIO DE JANEIRO.—United States Consul T. Adamson reports, for the three weeks ending October 16, 5 deaths from yellow fever, 2 from small-pox, 2 from typhoid fever, 15 from pernicious fever, and 92 from consumption. Population, 330,000; annual death-rate, 24.3 per 1,000. Yellow fever is declining, 3 of the 5 deaths occurring in the first week of the three reports.

SANTIAGO DE CUBA.—The report of United States Consul J. C. Landreau for the month of August gives 151 deaths from yellow fever, 40 from small-pox, and 9 from typhoid fever, out of a total of 402 deaths in a population of 40,000. These figures would give an annual death-rate of 118.3 per 1,000. No yellow fever or small-pox being reported in or near the harbor, clean bills of health are still granted to vessels clearing for the United States. The cases of yellow fever were almost confined to the Spanish troops. Mean temperature, 83°.

For the month of September there were 66 deaths from yellow fever, 31 from small-pox, and 10 from typhoid fever. Total deaths, 245; annual death-rate, 74.5 per 1,000. Mean temperature, 83°. Clean bills of health given to vessels having no sickness on board.

VALPARAISO, CHILI.—United States Consul L. H. Foote reports for the month of August 62 deaths from consumption, 73 from other lung diseases, 73 from fevers, and only 4 from small-pox. Total deaths, 401; population, 101,085; annual death-rate, 46.7 per 1,000. Referring to the virtual extinction of small-pox, which for some months caused an enormous mortality, the consul observes that with even a little care the city should be kept free from epidemic diseases. The sanitary condition has of late been much improved by copious rains which have washed out the open sewers and drains.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge, in his report for the week ending October 31, reports 17 deaths from yellow fever, of which 3 occurred in the week previous, but were not then known to the authorities. The recent increase of yellow fever has been at the time when the "northers" begin, and these cold winds have always been looked for as bringing a cessation of the disease, if prevailing. Mean temperature 84°. Sanitary condition of the city very good.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BURLINGTON, VT.—Under date of November 10, Dr. G. M. Ockford reports that the general health of the city has been good during the past month. Scarlet fever continues to prevail, but mostly of a mild type; rheumatic affections seem to be the principal *sequelæ* of the disease. Diphtheria has increased and caused three deaths during the month; two of these were of children in one family, and the third a child of the physician who attended the other cases. This latter case proved fatal in four days, and a marked feature of the disease has been a tendency to hydrocephalus and other affections of the brain in young children.

HAVANA, CUBA.—During the week ending November 12, there were 7 fatal cases of yellow fever, one of them being the steward of the American schooner *Jefferson Borden*, who died on board. The steamship *City of Merida* left Vera Cruz on the 4th, and sails from Havana for New York on the 13th. One of the passengers died on the voyage to Havana. He was a member of an opera troupe which had been engaged for the past month in Vera Cruz, and as another of the troupe came ashore at Havana with undoubted symptoms of yellow fever, it is inferred that the former death was from that disease. Disinfection of the rooms occupied by these two persons will be attended to before the steamer leaves for New York. The following vessels are believed to have had yellow fever on board while at Havana, though more than fifteen days have elapsed since the last case: Spanish brig *Pedro Turull*, for Charleston, November 9; Spanish brig *Julito*, for New Orleans, November 9; Spanish brig *Maria*, for New Orleans, November 9; Spanish bark *Valparaiso*, for Charleston, November 10; Spanish bark *Felo*, for Charleston, November 10; and the Spanish brig *Soberano III*, cleared for Charleston.

The following reports, for the week ending November 13, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 1. Allegheny, Pa., 78,000; deaths, 26; under 5 years, 10; consumption 4, diphtheria 3, enteric fever 1, scarlet fever 3, lung disease 3, measles 1. Brattleboro', Vt., 6,000; deaths, 1. Bucyrus, Ohio, 3,950; deaths, 1. Calais, Me., 6,162; deaths, 1; under 5 years, 1; accident 1. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 6,400; no deaths. Clinton, Mich., 1,205; deaths, 1; under 5 years, 1; lung disease 1. Corinth, Miss., 2,264; deaths, 2; under 5 years, 1. Crystal Springs, Miss., 955; deaths, 1. Dallas, Tex., 10,300; deaths, 4; under 5 years, 2; diarrhœa 2, malarial fever, 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Helena, Mont., 3,610; deaths, 3; under 5 years, 2; diphtheria, 1. Hernando, Miss., 1,000; deaths 1. Huntingdon, Tenn., 1,200; no deaths. Iuka, Miss., 816; deaths, 1; consumption 1. Jefferson, Tex., 3,251; deaths, 4; under 5 years, 4; enteric fever 1, malarial fever 1, puerperal 1. Lebanon, Pa., 9,000; deaths, 1. Madison, Ind., 9,009; deaths, 6; under 5 years, 5; scarlet fever 4. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; death, 1; under 5 years, 1; croup 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; deaths, 2; consumption 1, scarlet fever 1. Nebraska City, 5,200; deaths, 2; diphtheria 1, enteric fever 1. Niles, Mich., 4,199; no deaths. Okolona, Miss., 2,000; no deaths. Painesville, Ohio, 5,504; deaths, 2; consumption 1. Pearlington, Miss., 1,200; no deaths. Plymouth, Mich., 3,000; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; no deaths. Ripley, Miss., 1,000; no deaths. Rock Island, Ill., 12,000; deaths, 4; diphtheria 1, croup 1. Santa Cruz, Cal., 5,000; no deaths. Starkville, Miss., 1,454; deaths, 1. Steubenville, Ohio, 13,500; deaths, 6; under 5 years, 2. Summit, Miss., 1,808; deaths, 1. Tampa, Fla., 750; no deaths. Titusville, Pa., 9,000; deaths, 2; croup 1, enteric fever, 1. Winchester, Va., 5,000; deaths, 1; under 5 years, 1. Youngstown, Ohio, 15,089; deaths, 7; under 5 years, 4; consumption 1, diarrhœa 1, enteric fever 1, accident 1. Total population, 263,148; deaths under 5 years, 35; total number of deaths, 83; annual rate per 1,000, 16.6.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, DECEMBER 4, 1880. [No. 23.

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

NATIONAL LEGISLATION.

By STEPHEN SMITH, A. M., M. D., of New York.

On the organization of the Federal Government, in 1789, several of the sea-board States had quarantine laws and regulations of more or less efficiency. In most of these States the laws were originally adopted by the colonial governments, and in some they had been in effect for nearly a century. South Carolina enacted a quarantine law as early as 1698, Pennsylvania in 1699, Rhode Island in 1711, New Hampshire in 1714, New York in 1758. These early laws were chiefly designed to prevent the importation of small-pox, though yellow fever and ship or typhus fever had attracted attention as diseases capable of transportation. Yellow fever had several times, but at long intervals, been epidemic in sea-board towns having a large commerce with the West Indies, as at Boston in 1693; Philadelphia in 1699, 1741, 1747, 1762; New York, 1702, 1743; Charleston, 1699. But it did not attract general attention nor excite great public alarm until commerce with the West Indies, after the Revolutionary war, was fully established. From 1762 to 1791 the country was entirely free from yellow fever. This immunity has been attributed to the parliamentary acts known as the "commercial monopoly," and the war of the Revolution, which prevented all direct commerce with the West India ports and the United States. With the restoration of an active commerce with the West Indies yellow fever again began to make its appearance in those ports where this trade was most active. The first outbreak occurred in New York in 1791, in the West India shipping, and the pestilence proved very severe and fatal, and caused great public alarm. In 1793 it appeared in Philadelphia, and was then universally attributed to the shipping from the West Indies. The pestilence now began to excite public alarm, especially in neighboring cities having personal and commercial intercourse with Philadelphia. New York, Chestertown, Baltimore, and Annapolis took active measures, and finally established rigid land quarantines against Philadelphia. In 1794 it appeared in New York, Philadelphia, and Baltimore, and the public excitement was so great that there was a renewal of the land quarantines in various sections. In 1795 the fever again prevailed at New York and Norfolk, Va., and vigorous measures of protection were discussed and adopted by the authorities of other exposed towns. It would be impossible at this distant period to properly estimate the current events of the time when yellow fever first became widely epidemic at the close of the last century, had we not passed through a similar epidemic in 1878–'79. Then, as now, the disease was regarded as contagious and infectious, and all of the precautionary measures were designed to prevent the contact of the sick with the well. Maritime and land quarantines were established, and the latter was enforced with the shot-gun. In most of the details the measures of prevention in 1793 were the same as in 1878, more than three-quarters of a century later.

In order to understand the first act of Congress relating to quarantine it will be necessary to refer to the exciting events of that period. The following extracts from the papers of that date, kindly furnished by Dr. J. M. Toner, of Washington, reveal the intense excitement of the communities living in immediate communication with the centers of infection.

In 1793 the citizens of "Chestertown", Pa., held a public meeting. Their first resolve was: "It appearing to this meeting, from the information they have received, that the said disorder (an infectious disorder which at present prevails in the city of Philadelphia) has extended itself from Philadelphia to Trenton, Princetown, Woodbridge, and Elizabethtown, on the post-road to New York, it is the opinion of the meeting that the same has been occasioned by the stages passing through those places."

"2d. *Resolved, therefore,* That it is necessary and proper for the welfare of the inhabitants of this town that the stages should not pass through this place, and that notice of this resolution be given to the stage owner; and further, that if the said owner should refuse to comply with this resolution, that then the chairman shall call a second meeting to deliberate on and adopt such measures as self-preservation may in that case dictate and justify."

The mayor of New York, Richard Varick, issued a circular to the profession of that city, September 11, 1793, stating that "Great apprehensions are entertained by many of our fellow-citizens that, notwithstanding every prudent and legal precaution, the contagion of that distressing infectious disorder may be brought into this city by means of the open intercourse between the two cities, which cannot be lawfully interrupted by any power in this State." He informed them that a hospital had been provided for the sick, and requested reports in writing of every person arriving from Philadelphia who should be taken sick.

On the 17th September it is stated that "The corporation, at the request of the citizens of New York, have come to a resolution absolutely to prevent all intercourse between this city and the city of Philadelphia, and for this purpose guards are set at the different landings with orders to send back every person coming from Philadelphia to this city; and if any persons shall be discovered to have arrived in this city after this date, it is the resolution of the citizens immediately to send them back."—(Maryland Journal and Baltimore Advertiser, September 24, 1793.)

On the 12th September of the same year the governor of Maryland issued a proclamation establishing a rigid maritime and land quarantine. One provision is as follows: "And I have, with the advice of the council, thought further to direct that all persons coming to Baltimore Town, to Havre de Grace, to the Head of Elk, or by any other route making their way into this city from Philadelphia, or any other place known to be infected with the said disorder, shall be subject to be examined, and prevented from proceeding, by the person who will be appointed for the said purpose."

The plan of requiring each traveler to carry certificates of not having been recently exposed to the fever was also adopted, as appears from the following:

On the 24th September the citizens of Havre de Grace held a public meeting "to take into consideration their exposed situation on the post-road from Philadelphia, where a malignant fever now rages with great virulence," and passed the following resolutions: 1. That it is our opinion that no persons should be suffered to cross the Susquehanna who do not bring with them certificates, signed by some magistrate, of their not having lately come from Philadelphia or any other infected place. 2. That the citizens of this place embody themselves and act as a guard at the lower ferry of the Susquehanna to prevent any person crossing that does not come with the above certificate.—(Maryland Journal and Baltimore Advertiser, September 27, 1793.)

In other instances travelers were questioned under oath as to their recent movements. The corporation of Annapolis, Md., passed an ordinance September 27, 1793, appointing a health officer and requiring him "to examine upon oath or otherwise all strangers that may come to this city by water or in stages, and if, upon such examination, he shall be of opinion that there is no reason to apprehend that the said disease, or any other malignant disorder, will be communicated or introduced by the person or persons so examined, he shall grant a certificate or certificates to that effect." Another officer was required "on Mondays and Fridays to attend at the entrance into the city by land and give information to the said health officer of the arrival of the stage." The inhabitants were forbidden to harbor any traveler who had not been examined, as follows: "That whatever inhabitants of this city, or the precincts thereof, shall, after the publication of this by-law, take or receive into his or her house or family any person who shall come to the city in a stage, or any person who shall come to this city by water, until such person shall have obtained a certificate from the health officer of the city * * * shall forfeit and pay the sum of three pounds."

The inconveniences which travelers experienced by this land quarantine may be inferred from occasional letters of correspondents. A gentleman who left Philadelphia for the South, wrote, September 25 (Maryland Journal and Baltimore Advertiser, September 27, 1793): "We were stopped about seven miles from Baltimore by armed men who used us with every indignity and hatred truly indicative of *malice prepense.* These detained us in the stage from five in the afternoon until ten the ensuing morning. During this interval one of these ruffians, who appeared to be a German, snapped his piece at one of our party who seemed inclined to leave the stage with the apparent design to go in among the bushes near the road. This guard in their tender mercy were pleased to hand us a piece of dry cheese on the end of a pitchfork. After this quarantine we were permitted to go to Gray's Garden and thence to perform another for the space of two days and nights."

Another writes on the same date from Philadelphia: "On Friday evening all the New York and Philadelphia land stages returned to this city with their passengers mortified and fatigued. They were refused a passage through New Jersey. One of the drivers had a very narrow escape with his life, being cruelly fired upon at Trenton;

the ball passed within a few inches of his ears. No provisions were to be obtained on the road nor any accommodation of any kind even for the lady passengers."—(Virginia Chronicle and Norfolk and Portsmouth General Advertiser, October 5, 1793.)

In 1794 Philadelphia had an opportunity to retaliate upon Baltimore, where yellow fever prevailed severely. October 3, 1794, a public meeting was held in Philadelphia "to take into consideration the propriety of stopping all communication with the town of Baltimore during the present contagious disorder now raging in that place." At a subsequent meeting it was unanimously resolved "to stop the intercourse between this city and Baltimore, by land and water, on account of the contagious disorder now raging there; and a committee of twenty was appointed to see that this retaliation be carried into effect in such a way as to occasion the least possible injury to the public or breach of humanity to individuals." (Virginia Gazette and Richmond and Manchester Advertiser, October 16, 1794.) The governor of Virginia also issued a quarantine proclamation against all vessels from the port of Baltimore.

In 1795 Philadelphia also adopted a rigorous maritime and land quarantine against New York and Norfolk, Va., very much to the annoyance of New York. The governer of Pennsylvania, Hon. Thomas Mifflin, requested the board of health of Philadelphia, August 29, 1795, to inform him as to the prevalence of "a contagious disorder" in New York. The reply was that there was sufficient reason to believe that "a contagious fever" existed in that city, and that "the urgency of the case and the present anxiety of the citizens will justify" the stoppage of all intercourse between the cities. On August 31, 1795, the governor issued his proclamation, "with a sincere regret for the unhappy occasion," prohibiting for the term of one month, or until such prohibition shall by proclamation be lawfully removed, all intercourse between the said city of Philadelphia and the said city of New York and the said town of Norfolk, and any place or places within five miles thereof, respectively, as well by land as by water; the authorities of Philadelphia were directed, "with all possible vigilance and lawful authority and power, to guard the various avenues or entrances into the city of Philadelphia by land and water, so that any person or persons having been in the said city of New York or the said town of Norfolk within the space of ten days, and attempting to transgress the said prohibition by approaching nearer to the said city of Philadelphia than five miles, shall be forthwith remanded to the place or places whence such person or persons respectively came," &c.—(American Daily Advertiser, September 2, 1795.) On the 4th of September the New York board of health protested against the proclamation, and condemned the Philadelphia board for obtaining information through other channels than its own official records. The chairman of the health committee of the New York board, John Broome, wrote to the chairman of the Philadelphia board, Richard Zittermary, September 4, alleging: "The committee are so thoroughly persuaded that any information the inspectors of the board of health may have received which can justify the proclamation in question is unfounded that they have directed me to request from you, as chairman of the board of health for the city and liberties of Philadelphia, copies of the several letters as far as respects such information, together with the names of gentlemen who wrote them, and to express a hope that on future occasions the inspectors of the board will do them the justice to believe them full as capable and equally disposed with any individuals of this city to give every necessary information on a subject so interesting to the happiness and interests of both places."—(American Daily Advertiser, September 23, 1795.) The Philadelphia board refused to comply, as it would be a breach of confidence.

The governor of New York, Hon. John Jay, addressed a letter to the Medical Society of New York, September 4, asking for information in regard to the alleged contagious disease. He said: "The proclamation, by exciting alarms and apprehensions throughout this and neighboring States and in foreign countries, naturally tends to produce embarrassments to the commerce of this city, and to interrupt that intercourse with the country which is at all times necessary to the convenience and interests of both." The Medical Society, through its president, Dr. John Carleton, acknowledged the prevalence of a fever in low situations having an easterly exposure, with virulent symptoms which characterize fevers of the malignant sort. But though "the sensibility of the public mind on a subject of this nature, giving reality to apprehension, converted the necessary efforts for security and prevention into sources of fear and terror," the collective opinion of the society was that the fever was slightly, if at all, contagious, and was the same that occurred annually, having been rendered more malignant by local causes.

Governor Jay communicated these facts to Governor Mifflin, but the proclamation was not modified, and expired by limitation.

The public feeling in New York in regard to the proclamation of non-intercourse with Philadelphia appears in the following extract from the Daily Advertiser, New York, September 7, 1795: "The prohibition of intercourse between this city and Philadelphia is a proceeding very singular, and deserves severe animadversion. It is a measure that, to say the least, wears the aspect of a most unfriendly disposition, as it naturally tends to create unnecessary fears abroad, which may occasion an order for our vessels to perform quarantine in foreign ports to the great injury of our trade.

"It seems the board of health of Philadelphia reported to the governor the existence of a contagious disease in this city on the authority of private letters, without even writing to our health committee for a state of facts. This is a most extraordinary proceeding, when the reports of our committee have repeatedly informed the public that the epidemic now prevailing exhibits no decisive evidence of a specific contagion. Scarcely in one instance has an attendant on the sick taken the disease.

"This fact was known to the board of health and the governor of Pennsylvania, and yet the world is to be alarmed for the safety of Philadelphia, when the disease has not proved contagious enough to occasion any general alarm in New York. The disease is almost wholly local. Most parts of the city are entirely free from it. But one person died yesterday, and not more than five or six dangerously ill. In the name of common sense, must all the business of New York be impeded by the ill-timed inquiries of Philadelphia? Is this a generous return for $5,000 raised in New York to assist the suffering poor of Philadelphia during their great calamity? When dangers become real, will not the citizens of New York be alarmed? Let the public judge. The epidemic of this city is not a new disease. It is a disease that occurs more or less at this season in most of the seaports. It is not the disease that should occasion alarm, but its contagion, which depends mostly on local causes."

This protest of the New York papers seems very familiar reading in our time, and equally so the response of the Philadelphia correspondent of the Daily Advertiser. He writes, September 10: "Our New York brethren, it seems, are very angry at the proclamation of our governor prohibiting the intercourse for one month, unless after ten days absence, and complains that our board of health advised it, without writing to New York to obtain a state of facts. That they should be angry is very natural, but that the suspension of direct intercourse, for the present, take place, is no less just. The proclamation, however, was not issued before sufficient information was obtained of its necessity, though this did not come from the committee of health. On the contrary, every measure had been previously taken to have a true knowledge of the facts, and the result was that an epidemic fever raged in the upper part of the city, of which numbers died; that it was highly malignant, consequently there was every just reason to apprehend its introduction into this city, and self-preservation justified the measure adopted. The citizens of New York should recollect that the first alarm of this fever originated full six weeks since, and that it was not until two weeks past that the committee would even allow the existence of any fever than the common one of the season; that at least, when increasing mortality could no longer justify an attempt to conceal the truth, they did acknowledge the existence of an epidemic, but asserted its confinement to the upper party of the city. This was enough of itself, as it is ridiculous to suppose that a fever which had been gradually increasing for three weeks was not spread by contagion. The yellow fever of 1793 in Philadelphia was also chiefly confined for the first month to the neighborhood of its original appearance; the rest of the city was never more healthy, as is now rung in our ears constantly with respect to New York. But how did this fever of Philadelphia spread, and how is that now spreading at New York? We all know how positively the Baltimore committee denied last year that the yellow fever prevailed there; it was the bilious fever, fall fever, prevailing fever, unknown fever, every name but the right one was given it; thus it is at New York. It appears that both our port physicians wrote for the true state of the facts, and instead of these we have a lengthy disquisition upon the origin of contagion. * * * The citizens of New York should recollect that a burnt child dreads the fire, and that though the intercourse is prohibited, yet that humanity is joined with our precaution, and so far from firing upon their stages, denying the passengers any food but at the point of a pitchfork, and obliging them to sleep in the woods, nay even mixing the healthy with the sick upon Governor's Island, all of which were done to those from Philadelphia in 1793, the people of New York are merely prevented from coming nearer to this city than five miles, where they may meet with every accommodation and transact their business by letter."

Richmond and Petersburg, Va., quarantined against Norfolk. At a meeting held in Richmond, August 27, 1795, it was resolved, "That the committee appointed at a late meeting for the purpose be immediately authorized to engage a proper vessel and guards, and to lay such restrictions on the entrance of passengers, carriages, and goods, by land or water, into this city from Norfolk, or any other place infected with the pestilential fever now raging at Norfolk, as to them shall appear necessary."—(American Daily Advertiser, September 7, 1793.) Owing to the death of a person at Petersburg, who came from Norfolk sick with the fever, "guards are now placed out, to stop all persons coming from Norfolk to this town by land or water."—(American Daily Advertiser, September 9, 1795.)

The Fourth Congress met at Philadelphia, December, 1795, at the close of one the most alarming and widespread epidemics of yellow fever which had as yet been known. The conflicting opinions and acts of different State and municipal authorities in the adoption and enforcement of measures for preventing the importation and spread of yellow fever had excited much public comment. The fever was believed to be imported, and existing quarantines were regarded as inefficient, owing to a want of power on the part of the States to enforce their regulations. The questions which were raised in Con-

gress were twofold viz: 1. Should not the establishment and management of quarantines be exclusively the duty of the general government, under the provision of the Constitution empowering Congress "to regulate commerce"? 2. Is not a quarantine a police regulation of the State or municipality, and hence quite outside of this provision of the Constitution?

It is now a matter of great interest to understand the opinions of those who took part in the first discussion of the relations of the general and the State governments in the establishment and administration of maritime quarantine. The debates on the quarantine bill are, therefore, given in full. The first representative who moved in the matter was from the State of Maryland, and the measure which he proposed was designed to place the quarantine systems of the United States entirely under the direction of the President, who at that time was General Washington. From the annals of Congress it appears that on the 28th of April, 1796, Hon. Samuel Smith, of Maryland, proposed a resolution to the following effect, which was referred to the Committee of Commerce and Manufacture to report thereon:

"*Resolved*, That the President of the United States be authorized to direct such quarantine to be performed on all vessels from foreign countries arriving at the ports of the United States as he shall judge necessary."

The committee consisted of the following members: Goodhue, of Massachusetts; Bourne, of Rhode Island; Livingston, of New York; Swanwick, of Pennsylvania; Smith, of Maryland; Parker, of Virginia; Smith, of South Carolina.

May 7, 1796, the committee reported a bill to regulate quarantine, which was read twice, and referred to a Committee of the Whole.

It was as follows:

"*Be it enacted, &c.*, The President of the United States be, and is hereby, authorized to direct at what place or station in the vicinity of the respective ports of entry within the United States, and for what duration and particular periods of time, vessels arriving from foreign ports and places may be directed to perform quarantine.

"*Be it enacted, &c.*, That the President of the United States be, and is hereby, authorized to direct the revenue officers, and the officers commanding ports and revenue cutters, to aid in the execution of quarantine, and also the execution of the health laws of the States, respectively, in such manner as may to him appear necessary."

On May 11, 1796, on motion of Mr. S. Smith, of Maryland, the House resolved itself into a Committee of the Whole, on the bill regulating quarantine.

Mr. Heister, of Pennsylvania, objected to the principle of the bill, as it proposed to take power from individual States to regulate what respected the health of their citizens, and to place it in the President of the United States. He thought the measure would be attended with very great incovenience. Many States lay very distant from the seat of government, and before information could be given to the President of the apprehension of any pestilence being introduced, and his answer received, the disease might be introduced into the country and great havoc made among the citizens. It appeared to him that the government of each individual State was better calculated to regulate quarantine than the general government, because upon the spot. And if the power was to be transferred from the President to the collectors at each port (that he conceived must be the case), it would put a vast deal too much power in their hands.

Mr. Smith, of Maryland, said that each individual State had, or might have, its own health laws, but the performing of quarantine was in the direction of the general government. The President ought to be empowered to designate the place where vessels should perform quarantine, to enforce the performance, and to determine at what time of the year it should commence and end. It ought, he believed, to commence at the present time.

Mr. Kittera, of Pennsylvania, understood that each independent State had a right to legislate on this subject for itself; and if they had no regulations on the subject it was because they had not felt the want of them. He believed that each State understood its own concerns better than the general government, and therefore the regulation might safely be left with them.

Mr. Smith, of Maryland, denied that there was any authority in the State governments to regulate quarantine. They could not command the officer of a port to use force to prevent a vessel entering their ports; the authority over him was in the general government.

Mr. Milledge, of Georgia, opposed the bill. He said the State from which he came was in the habit of regulating quarantine, and that it would be attended with many inconveniences, if the power was to be placed in the general government, to the State which he represented; on account of its distance, it would be particularly objectionable.

Mr. Giles, of Virginia, said that self-preservation justified every State in taking means to prevent the introduction of diseases among its citizens, and he thought the bill unnecessary.

Mr. Smith, of South Carolina, said the Constitution did not give to the State governments the power of stopping vessels from coming into their ports.

May 12th.—Mr. Heister, of Pennsylvania, moved to strike out the first section. It appeared to him as if it would be taking the power of regulating quarantine from the State governments and placing it in the hands of the collectors at different ports; and, as he believed the collectors were interested in proportion to the quantity of goods imported, the health of our citizens and the interest of the collectors would be placed in opposition to each other.

Mr. Bourne, of Rhode Island, hoped the motion would not be agreed to. He thought it a necessary regulation. No inconvenience, it was true, had occurred in the State he represented, but he believed they were liable to inconveniences from the want of such a law as this. By the aid of custom-house officers, who had concurred with the State, they had been able to effect every necessary regulation: but if these officers had refused them aid, they could not have stopped vessels with infectious diseases from coming into port—it being of the nature of a commercial regulation, to which, by the Constitution, Congress alone were competent. Without the first clause there would be a radical defect in the bill.

Mr. Swanwick, of Pennsylvania, said if the section were struck out the bill would have every desirable effect. All that was complained of was that the authority of any individual State could not compel vessels to perform quarantine; but if the President gave directions to the officers of the United States at every port to aid the State governments in this respect, every effect would be obtained. The first section of the bill went only to direct the time during which quarantine should be performed, and at what particular place, which would certainly be best determined by the State governments. Indeed, most of them having already fixed on places for the purpose, and erected suitable buildings for the sick, for purifying goods, &c., it would be attended with very great inconvenience if a different place were to be fixed upon by the United States. It was said the right of regulating quarantine did not reside in the State governments; he believed it did, and that the individual States had conceived so was evident from the expense which some of them had been at in erecting buildings, &c., for the purpose. He particularly alluded to the provisions made for this purpose by the State of Pennsylvania, on the Delaware.

Mr. Sitgreaves, of Pennsylvania, would ask his colleagne to point out the inconveniences which would arise from passing the law in its present state. It was true that the State of Pennsylvania had made some regulations on the subject of quarantine; but, without the aid of the United States, they could not carry them into effect. They may direct, by their governor and board of health, quarantines to be performed, but they could not enforce any vessels to observe their directions, without the aid of the general government. Some States had, on this subject, no institutions at all; and where they existed it was reasonable to suppose that they would be properly respected by the President in the arrangements he should make under a law like the present. At any rate, no inconvenience need be apprehended from an exercise of a concurrent jurisdiction. If a State should direct one term of quarantine to be performed, and the President another, the longest term, which will comprise both, must be submitted to. But the strongest and best reason for a law such as the one proposed, is that it is matter of very serious doubt whether, upon this subject, the States had any authority at all, and whether all such power is not vested by the Constitution in the Congress, under their general authority to regulate commerce and navigation. He inclined to the last opinion, and believed, upon examination, it would appear to be well founded. On the whole, the provision contemplated might produce good effects, and could not be followed by any evil consequences, and therefore he should vote for it.

Mr. Milledge, of Georgia, spoke in favor of striking out the first section, and of the power of regulating quarantine being in the State governments. Savannah, in Georgia, he said, was one thousand miles from the seat of government, and, from their situation in respect to the West Indies, they were very subject to the evil of vessels coming in from thence with diseases; and if they were to wait until information could be given to the President of their wish to have quarantine performed, and an answer received, the greatest ravages might in the mean time take place from pestilential diseases. The State of Georgia had a long law on the subject, and had always been in the habit of regulating quarantine without consulting the general government.

Mr. Bourne, of Rhode Island, spoke again in favor of the bill. It had been objected against the bill that the State might order quarantine to be performed for one length of time and the general government another; that difficulty would be got over by observing the longest period.

Mr. Giles, of Virginia, said there appeared to him several inconveniences attending the bill. The gentleman last up stated that if a longer time was ordered for quarantine to be performed by either the State or general government it should be obeyed in preference to the shorter. He believed this would not prove satisfactory. But how did the gentleman propose to get over the difficulty of different places being appointed by the two governments? If, said he, the States had already fixed upon times and places of performing quarantine, he thought it necessary for the general government to interfere in altering them. He thought both time and place should be fixed by the State; but if it were the business of the general government, it was legislative and not executive business. It was said some of the States had no regulations with respect to quarantine; but, if they had not, when they found a necessity for them they would have them. It had been said that every useful purpose would be answered by the last

clause; why, then, retain the first, against which there are so many strong objections? He hoped it would be struck out.

Mr. Kittera, of Pennsylvania, asked if a State should think it necessary to change the place of performing quarantine whether the President could always have notice of the change in time, so as to make his regulations accordingly. He believed not. This would be one of the inconveniencies which would arise from the first clause. He thought the second would answer every desirable purpose.

Mr. Smith, of Maryland, said that gentlemen who opposed the present bill insisted upon the authority to regulate quarantine being in the State governments. The gentleman from Pennsylvania (Mr. Swanwick) said that each State had its buildings for the purpose. This was not a fact. Some of the States had no regulations on the subject. At Baltimore they had built a hospital four miles from the port, but the State had no authority to stop vessels at it. He asked the gentleman from Georgia (Mr. Milledge) whether there was any power in that State which could stop a vessel of his from going into Savannah though she had sickness on board? He denied that it had. She will sail into port in defiance of their State laws. It was a commercial regulation, and, therefore, the business of the general government. Mr. S. said he brought in this bill that the regulations respecting quarantine might be authorized by the proper authority. It could not be supposed that the President would alter the places already fixed upon by the individual States without such good reasons as would convince them of its necessity. To suppose the contrary was an unworthy suspicion that the Executive would abuse his power. There were States which had no laws upon the subject. Maryland had a law which had been sanctioned by a law of the general government, and had been renewed this session.

Mr. Williams, of New York, observed that the gentleman last up had said that regulations respecting quarantine were commercial regulations, and therefore vested in the general government. The State of New York had never found any difficulty in causing vessels to stop at a certain place to perform quarantine. Philadelphia and New York had had occasion to make alterations with respect to the proper places of stopping, and they were certainly the best judges as to the propriety of those alterations. It appeared to him that the second clause would answer the purpose wanted. Not that he was by any means jealous of the power of the President, but he believed it would be best for the States to have the power of directing the time and place of performing quarantine, as they could more effectually carry their regulations into effect. The second clause directs that the officers of the general government shall aid State governments, which is all that is necessary.

Mr. W. Lyman, of Massachusetts, thought the individual States had the sole control over the regulations of quarantine. It was by no means a commercial regulation, but a regulation which respected the health of our fellow-citizens. In the town of Boston the small-pox was considered as pestilential disease, and they certainly had a right to make their regulations accordingly. He knew the United States could prohibit the importation of goods, but he did not think it was in the power of the United States to prevent the landing of persons. He believed the bill was unnecessary; that individual States had a right to make such regulations as were necessary for the preservation of the health of their citizens.

Mr. Hillhouse, of Connecticut, said if gentlemen had been as near infectious disorders as he had been, they would have been convinced of the necessity of making some such regulations as were now proposed. He was not surprised that gentlemen who lived several hundred miles from the shore did not feel anxions about the matter. He thought it was an object which merited the attention of Congress. He knew there were local regulations in many States relative to this subject, which he did not wish to destroy. Gentlemen might as well say that the individual States had the power of prohibiting commerce as of regulating quarantine, because, if they had the power to stop a vessel for one month, they might stop it for twelve months. This might interfere with regulations respecting our trade and break our treaties. At the same time, he allowed that the States were the best judges of time and place. Mr. H. proposed two amendments. One was, that the President should make regulations where individual States had not already done it; the second was to make it the duty of officers of the United States to assist the State governments to carry into effect their several laws, until Congress shall make regulations to the contrary.

Mr. Gallatin, of Pennsylvania, said he did not agree in the least with the gentleman from Maryland (Mr. Smith), that the power of regulating quarantine was exclusively in the United States. He conceived the only clause in the Constitution which could at all countenance such an idea was the article relative to commerce; but, he said, the regulation of commerce had nothing to do with commerce. It was a regulation of internal police. It was to preserve the health of a certain place, by preventing the introduction of pestilential diseases, by preventing persons coming from countries where they were prevalent. Whether such persons came by land or by water, whether for commerce or for pleasure, was of no importance—they were all matters of police. The individual States had thought themselves competent to prevent the introduction of slaves coming by sea, although that also might be called a commercial regulation, which they had no right to interfere with. And if a vessel belonging to the gentleman from Maryland was to come to the ports of Baltimore or Philadelphia with a cargo of negroes, he believed that the government of either place would be equal to the preventing of him from landing and disposing of them, though he would say it was an article of commerce. The State governments had also something to do with the internal regulations of their ports. That of Philadelphia was under the direction of wardens and of State laws. He had no objection to the United States assisting the individual States in enforcing their quarantine regulations, but he had an objection to their asserting that they had the sole right of making regulations on that head, or of making health laws for the individual States. He knew that where the legislatures of different States had legislated on the subject they had thought it an important branch of their duty. The words proposed to be introduced by the gentleman from Connecticut—"until Congress shall make regulations to the contrary"—seemed to say that the health laws of the several States were to continue only during the pleasure of Congress, but if the assistance of the United States was only necessary, the amendment of his colleague (Mr. Heister) would answer the purpose.

Mr. Smith, of Maryland, said the gentleman from Pennsylvania, Mr. Gallatin, differed in opinion from him with respect to the States having the power to stop vessels coming into their ports. It was true that the laws of the States of Maryland and Pennsylvania prohibited the importation of slaves, but a vessel might bring any quantity of negroes, provided, on landing, they were not sold. It has been said that the governor of Pennsylvania had stopped vessels from entering this port which were suspected of having diseases on board. That was, he said, before the fort was ceded to the Union. He had not the power now to do it. That such authority had been submitted to was true and proper, but he had no legal right to stop any vessel. The individual States make health laws, but they want the power to carry them into execution: they are good for nothing without such power. That the State of Pennsylvania had passed a health law and carried it into effect was no proof against his assertion. The law which he had now brought forward was meant to give full effect to the State laws. He had no objection to the amendment of the gentleman from Connecticut.

Mr. W. Lyman, of Massachusetts, observed that the gentleman from Maryland did not make the proper distinction. Quarantine was not a commercial regulation; it was a regulation for the preservation of health. If commerce was incidentally affected, it ought so to be, when the object was the preservation of health and life. The United States, it was true, could prevent the importation of any goods, whether infected or not, but it did not thence follow that they could permit the landing of infectious goods contrary to the laws of any State. The several States possessed the sole power over this subject. They were the best judges of the due exercise of it. The right to preserve health and life was inalienable. The bill was not only unnecessary and improper, but it was injudicious interference with the internal police of the States; neither would the amendment which had been offered by the gentleman from Connecticut (Mr. Hillhouse) ameliorate the bill; it would still be interfering with State policy. If that gentleman had any panics about infectious diseases, he might find relief in the laws of the State. If the laws there were not competent thereto at present, the gentleman might remonstrate to their legislature, and no doubt could exist but he would be suitably listened to. As to the argument that States neglected to make regulations, it proved that they supposed them superfluous. Whilst they forbear to do anything, it was proof that nothing ought to be done. The States are the best judges, and had the sole power to determine.

Mr. Kittera, of Pennsylvania, said his objections to the bill would be removed by the amendments of the gentleman from Connecticut. The only point in which they seemed to differ was, whether the President of the United States, or the government of each individual State, was best able to make the wisest regulations? If the first section passed, the President would most probably adopt the regulations of the different States; and, by the second, the officers of the United States are commanded to aid in the execution of the State laws.

Mr. Heath was in favor of striking out the first section: he was, in fact, opposed to the whole bill.

Mr. Hillhouse, of Connecticut, said the first clause might be struck out. It was only necessary where no regulation was made. It was said that a regulation of quarantine had nothing to do with trade, but if a State, in order to prevent the introduction of certain goods from a certain country, were to order a quarantine of twelve months to be performed, would it not be destructive of commerce? It certainly would; and if a State had the power of stopping a vessel one month she can extend it twelve, if she pleases.

Mr. Giles, of Virginia, said he did not know which States had legislated on this subject, and which had not. He did not know that any of the States had not legislated upon it; but if they had not done it, they could do it. The gentleman from Maryland (Mr. Smith) had said, to regulate quarantine was a commercial regulation. They were legislating, not upon commerce, but upon preventing the introduction of pestilential disorders. Were these objects of commerce? If a State stops a ship, she does not stop it on account of the goods it contains, but because it contains an infectious disorder, which, if it were considered as an article of commerce, certainly ought, at least, to be a contraband article. He did not believe there was any necessity of interference; but, if there was any want of ability to enforce obedience to the laws of the State, he had no objections to fur-

nish it, and that would be done by the proposition of the gentleman from Pennsylvania (Mr. Heister).

Mr. Swanwick, of Pennsylvania, said, if it were to be admitted that the general government were to take upon it the regulation of health, he would ask whether the first section of the present bill contained any regulation of this sort? The State of Pennsylvania, he said, had been at great expense in erecting necessary buildings for the reception of persons and goods infected with diseases. It was to be lamented that gentlemen had not before found out that this was the business of the general government, for it had been a very expensive undertaking to the State of Pennsylvania to provide the necessary buildings for carrying their quarantine and health laws into execution, and they would gladly have turned it over to the United States. He thought the utility of this business remaining in the State government was evident. Commercial regulations were placed in the general government to prevent one State having advantages over another in respect to commerce; but with respect to health, every State was certainly the best judge, and the claim was imperious; and if it were under the power of the general government, and government was to neglect to take the necessary measures, the State would itself take them. During the late sickness at New York it was thought necessary to appoint special committees to aid the State government in this city. The gentleman from Maryland had asked if a State government could stop a vessel from entering any of its ports? If not, they had been infringing on the laws for several years. The governments of New York and Pennsylvania were in the constant habit of preventing ships from entering their ports until they had been examined with respect to their healthiness. Gentlemen had talked about their abode being near or distant from seaports. He could see no use in such observations. It was certainly of first consequence to guard the health of their citizens by every possible means. He said at this port they had laws respecting wardens; there was also in the different States inspection laws, which in some degree affected commerce, but were not the kind of regulations prohibited by the Constitution; these did not interfere with the rights of Congress to regulate commerce. Gentlemen had brought another subject into view, which he could not see any good reason for doing; they had charged gentlemen opposed to this law with being unreasonably jealous of the power of the Executive. Surely, to prevent the landing of diseased persons, or infected goods, could not have any relation to a jealousy of that power. This subject was too often introduced, when, he believed, there was no real occasion for it, though he hoped they never should be wanting in entertaining any justifiable jealousy of the extension of any of the powers of government, if these should be conceived to have been improperly exercised, buthe knew of nothing of this kind at present.

Mr. Smith, of South Carolina, said if this question be a mere question of acquiescence in the State laws there might be a propriety in the Federal government overlooking those laws; but it was essentially connected with the powers of Congress on an important subject. He had been surprised to hear gentlemen assert that this subject was not of a commercial nature. The gentleman from Virginia (Mr. Giles) had said diseases were not articles of importation, or, if they were, they were contraband; but gentlemen must know that importations of all kinds were under the regulation of Congress, and contrabands as much as any other. Consider how epidemical diseases, imported, affect the United States at large. They do not merely affect the city where first imported, but they obstruct the commerce of all others; they not only embarrassed the commerce, but injured the revenues of the United States. Another point of view in which it had an effect: The laws regulating the collection of imports were counteracted and obstructed by the laws regulating quarantine, and would any gentleman say that a State legislature had the power to contravene the act of the Federal government to obstruct all the laws by which it collects its revenues? It had been said that this subject could be better considered in each individual State than we could possibly settle it. Who are we? Are we a foreign government? Gentlemen had already forgotten their arguments on former occasions when speaking of the power of the House; they could then do anything and everything; and the people looked up to them alone for protection. If the subject was vested in the general government it was their business to protect the health of their fellow-citizens as much as their property; because, if the performance of quarantine was neglected such neglect naturally tended to affect the lives as well as the revenue and commerce of the citizens throughout the United States. He, therefore, thought it a subject perfectly within the Federal jurisdiction; and as there were States which had no law upon the subject, and as their legislatures had now generally risen, the passing of this law would prevent the necessity of resorting to revolutionary committees of their citizens. Their refusing to legislate upon this occasion would be inviting the people to do the business by committees. The gentleman from Pennsylvania (Mr. Swanwick) had referred to the laws of that State. He thought they had some very exceptionable laws; in particular, their poll-tax on persons coming by water into their State. He thought it would be deviating from the spirit of the Constitution.

Mr. Page, of Virginia, said he should vote for striking out the first section. He should even wish to vote against the bill itself, as it was an attempt to extend the power of the Executive unnecessarily. We might as well undertake to form a system of police for every city in the Union. The State legislatures could not be interested in opposing the landing of goods any more than Congress, and therefore would not be disposed to do it, except when their health would be endangered by it; but if he were to put in competition the interest of the revenue and the right of the people to preserve their health, which was one of the first rights of nature, he should certainly adhere to the latter at the expense of the former. The master of the vessel who refused to stop at the port of Baltimore, agreeably to the orders of the State government, might have been prosecuted at common law. If gentlemen had no other object in view besides the preservation of the health of their citizens, they ought to be satisfied with the second clause, which went to the directing of the officers of the United States to aid the State government in obliging vessels to perform the necessary quarantine. The first clause had only a tendency to extend the prerogative of the President.

Mr. Bourne, of Rhode Island, said gentlemen supposed it to be the duty of the President to co-operate with the individual State governments with respect to the performance of quarantine; but he believed the States would think it an improper interference except he were authorized by law. It was a duty of the President, expressly enjoined by the Constitution, to execute the laws of the Union, but it was not to execute the laws of the State. The gentleman last up had observed that self-preservation required that every State should attend to its own health; but it must be allowed without some check in the United States that the commerce and revenues of the United States were liable to be materially affected by the regulations relative to quarantines; for if the State governments were once allowed to have the power of stopping vessels to perform quarantine, they might prohibit the commerce of any country at pleasure; the vessels from any particular country might be stopped for so long a time, or totally prohibited so as to ruin the commerce with such country on pretense of the vessels containing diseased cattle or other infections. It would be said that this would be an abuse of the power which could not be expected, but if the States had the power they could exercise it as they pleased. If they had the power of regulating quarantine they could not carry it into effect without the aid of the United States, who alone possess the power of regulating navigation and commerce. And he believed that no damages could be recovered (as the gentleman from Virginia supposed) against any master of a vessel who had refused to obey the laws of any State with respect to the performance of quarantine, unless the authority of the United States should interpose by making some legal provision for their being carried into effect so far as they may relate to commerce and navigation.

Mr. Holland, of North Carolina, said that in an inquiry into the subject whether the general government or State legislatures were the best judges of the measures necessary to be taken for the preservation of the health of the several States, it would occur that, the extent of the country being so great, it would be difficult to say what regulation would be best suited to all the ports of the Union, for what would be salutary and proper for one might be improper for another. From this circumstance it would seem that each State should have the power to pass its own laws on this head, and, if so, the first clause should be struck out; to preserve one's health was an article of self-defense. Every individual should take his own measures to preserve his own health, and each State should judge of the best way of doing it for its own districts. He had no objection to the calling in of the aid of the general government to the execution of the State law, but not to regulate the time and place of performing quarantine. This was contemplated in the second resolution, and the first was therefore unnecessary. The Constitution being silent in respect to health laws, he supposed the passing of them was left to the States themselves. Those who yet have no laws on this subject will make them when necessary. The question, in his opinion, was by no means a commercial one. The gentleman from Maryland, being a commercial man, may be excused from considering it as one, as he readily converts most things into a commercial view.

Mr. Brent, of Virginia, was in favor of striking out the first clause of the bill under consideration, not from any jealousy of the Executive, but because the Constitution did not authorize such an interference. If the doctrines of the gentlemen from Maryland and South Carolina were true, they would swallow up all of the authority of the State governments. They had suggested that if the State legislatures had the power they might use it so as to injure the general government. He would ask whether this would prove that they did not possess the power? If they possessed the power and exercised it so as to injure the interests of the United States, the Constitution of the Union, he believed, would point out a remedy. The gentleman from South Carolina had said that if the State governments were possessed of this power they might impair the revenue of the United States, and that, therefore, being connected with commerce, the regulating of quarantine must be in the power of the general government. He would ask whether the different States had not the power of regulating the inoculation for the small-pox? Yet this might be so ordered as to affect the trade and commerce of this country, and yet no one would say they had not the power of doing this. If the construction now contended for was carried to its extent, there would be no bounds to it. The States had always been considered as possessing the power of regulating quarantine. Such

was the opinion at the time of adopting the Constitution, and under this impression the States had passed laws on the subject; nor did he believe that necessity, expediency, or policy required that the power should be changed. If this was the case, the question could only be brought forward for the purpose of establishing a constitutional principle, and which he should certainly oppose.

The question for striking out the first section was put and carried, 46 to 23; and the bill was ordered to be engrossed for a third reading.

Friday, May 23, 1796, the bill relative to quarantine was read a third time and passed.

In the Senate, Tuesday, May 24, 1796, Mr. Rutherford, of New Jersey, from the committee to whom was referred the bill sent from the House of Representatives, for concurrence, entitled "An act relative to quarantine," reported that the bill be amended by inserting, after the word "that," "until general regulations relative to quarantine are made by law." And on the question to agree to the report it was determined in the negative.

Wednesday, May 25, the bill was read a third time and passed.

Approved May 27, 1796.

(To be continued.)

ABSTRACTS FROM CONSULAR REPORTS.

MONTEVIDEO, URUGUAY.—United States Consul A. L. Russell reports for the month of August a total of 253 deaths, of which 3 were from typhoid fever.

NASSAU (N. P.), BAHAMAS.—United States Consul T. J. McLain, jr., reports that no case of yellow fever has occurred since October 1, and states that disease appears to have left the island entirely.

PARA, BRAZIL.—United States Consul N. C. Prindle, under date November 18, 1880, reports that city as healthy, with no suspicion of any contagious disease.

SANTIAGO DE CUBA, CUBA.—United States Consul John C. Landreau reports that for the month ending October 31 there was a total of 186 deaths. Of yellow fever there were 74 cases and 43 deaths; of small-pox, 39 cases and 17 deaths; of typhoid fever, 16 cases and 5 deaths. The cases of yellow fever occurred mostly among the troops, who are Spaniards. He also states that the harbor and vicinity still continue void of either yellow fever or small-pox, and therefore he issues bills of health to captains who call for same, bound to the United States, according to the health on board.

SINGAPORE.—United States Consul A. G. Studer reports, under date of October 18, that there has been no epidemic or contagious disease in his consular district since his last report.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge reports that for two weeks ending November 14 there were 69 deaths, of which 36 were from yellow fever. Total number of deaths for October, 153; yellow fever, 43. He states that the city was entirely free from yellow fever until the pavements were torn up to repair a street railroad, a belt ½ mile long by 12 feet wide through the center of the city. Simultaneously with the commencement of that work the disease appeared.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

DUBLIN, IRELAND.—Dr. Charles A. Cameron, F. R. C. S. I., forwards his report upon the state of public health in Dublin and the sanitary work performed there during the five weeks ending October 30, 1880. The death rate in the city during this period was 36.42 per 1,000 per annum, the total number of deaths from all causes being 857. Of these the deaths from the seven principal zymotic diseases were as follows: Small-pox, 6; whooping cough, 30; measles, 13; scarlet fever, 52; fevers, 27; diarrhœa, 71; diptheria, 2; all other zymotic diseases, 29; making a total of 230. The month was one of the coldest October on record, and the rainfall largely excessive, being over one-third of the usual annual precipitation. Several of the low-lying districts of the city and suburbs were flooded and many houses had to be vacated.

The severe weather produced an increase in the number of deaths from diseases of the organs of respiration.

HAVANA, CUBA.—During the week ending November 19, there were 5 deaths from yellow fever, four of which were among civilians, and but 1 in the military hospital.

Of small-pox 7 cases have been reported during the same period.

Two cases of yellow fever are reported to have occurred among the passengers on board the steamship City of Merida, while *en route* from Vera Cruz to Havana. One died; the other is now in hospital in Havana, having had black vomit, &c.

TUXPAN, MEXICO.—Under date of November 1, Dr. A. M. Boyd reports that, for the month ending October 31, the number of deaths from all causes was 22, viz, consumption, 2; diarrhœa, 1; dysentery, 1; convulsions, 3; malarial fever, 13; dropsy, 1; asthma, 1. Rate per 1,000 of population, 36.7.

He also states that the yellow fever season has passed and there has not been a single case, nor anything that resembles it, during the season, nor has there been any other disease of a contagious character. The sanitary condition of the port and vicinity is good.

The health officer of Yonkers, N. Y., Dr. Valentine Brown, states under date of November 20, 1880, that no deaths have been reported in that city for the eleven preceding days, and that only 20 deaths have been reported in fifty days ending on the above date. Malarial fevers seem to have disappeared and the city could be considered as free from all zymotic diseases. He attributes the exemption of Yonkers from any decided disease movement to the locality, water-supply, natural drainage, &c.

FEES FOR MEDICAL EXAMINATIONS ON BOARD OF VESSELS BOUND FROM FOREIGN PORTS TO PORTS WITHIN THE UNITED STATES.

The attention of consular officers is called to the following communication of the honorable Secretary of the Treasury, fixing the fees to be charged for medical examinations which may be made in their respective districts:

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., November 29, 1880.

SIR: Your letter of the 23d instant is received, in relation to a proposed schedule of fees to be substituted for the fee of twenty-five (25) cents for each person, established by department letter to you of September 1, 1879, for the medical examination of persons on vessels in foreign ports about to sail for ports in the United States.

You state that you are directed by the executive committee of the National Board of Health to say that, in its opinion, the proposed schedule is just and equitable, and will doubtless secure in each case an amount adequate to the expense incurred.

The department, therefore, directs that the letter of September 1, 1879, be so far modified as to prescribe fees for the personal examination authorized by the "act to prevent the introduction of contagious or infectious diseases into the United States," approved June 2, 1879, as follows:

Fees for medical examination of persons on vessels bound from foreign ports to ports in the United States—

For fifty persons and under	$5 00
From fifty to one hundred persons, for each ten additional persons or less	1 00

Over one hundred, at the rate rate of $5 for each additional hundred persons.

In the cases which have arisen at the port of Kanagawa, Japan, the fees will be adjusted and settled on the basis of the above schedule.

Very respectfully,

JOHN SHERMAN,
Secretary.

Hon. J. L. CABELL,
President National Board of Health, Washington, D. C.

NOTICE.

The United States consul at Londonderry, Mr. Arthur Livermore, under date of November 9, 1880, reports the existence of twenty-five (25) cases of typhus fever at that port. In his communication Mr. Livermore alludes to the disregard by shipmasters of the requirments in regard to obtaining a bill of health. The attention of quarantine officers is respectfully called to all vessels arriving with passengers from the above port without bills of health, and it is requested that notice may be given this office, at as early a date as possible, of any attempt at evasion of the act to prevent the introduction of contagious and infectious diseases into the United States, approved June 2, 1879.

The following reports, for the week ending October 2, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 2. Allegheny, Pa., 78,000; deaths, 28; under 5 years, 15; consumption 3, croup 1, diphtheria 3, enteric fever 1, scarlet fever 3, lung disease 3, accidents 1. Belfast, Me., 5,308; death, 2; under 5 years, 1; diphtheria 1. Brattleboro', Vt., 6,000; deaths, 3; under 5 years, 1. Carrollton, Miss., 600; no deaths. Chillicothe, Ohio, 11,000; deaths, 1; consumption 1. Circleville, Ohio, 6,400; deaths, 3; under 5 years, 1; croup 1, diphtheria 1, lung disease 1. Clinton, Mich., 1,205; no deaths. Corinth, Miss., 2,261; no deaths. Dallas, Tex., 10,305; deaths, 4; under 5 years, 1; diarrhœa 1, lung disease 1, accident 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Helena, Mont., 3,630; deaths, 4; under 5 years, 3; diphtheria 2, lung disease 1. Hernando, Miss., 1,000; death, 1. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; no deaths. Kenosha, Wis., 5,500; deaths, 3; diphtheria 1. Lebanon, Pa., 9,000; deaths, 3; puerperal 1, accident 2. Madison, Ind., 9,009; deaths, 8; under 5 years, 4; diphtheria 1, malarial fever 2, scarlet fever 1, puerperal 1, accident 1. Martinsburg, W. Va., 6,384; deaths, 2; under 5 years, 1; consumption 1, croup 1. Milledgeville, Ga., 3,000; deaths, 2; consumption 1. Monmouth, Ill., 6,000; deaths, 3; under 5 years, 2; diphtheria 1, accident 1. Montgomery, Ala., 17,000; deaths, 2; puerperal 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; deaths, 2. Muscatine, Iowa, 8,412; deaths, 2; consumption 1. Muskegon, Mich., 11,300; deaths, 6; under 5 years, 3; diphtheria 2, malarial fever 1, accident 2. Nebraska City, 5,000; deaths, 2; under 5 years, 1; diphtheria 1. Niles, Mich., 4,100; death, 1. Painesville, Ohio, 5,504; death, 1. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; no deaths. Pleasant Hill, Miss., 253; no deaths. Plymouth, Mich., 3,000; death, 1. Port Gibson, Miss., 1,200; no deaths. Rock Island, Ill., 12,000; deaths, 5; under 5 years, 3; enteric fever 1, scarlet fever 1, lung disease 1. Rockland, Me., 7,500; deaths, 4; under 5 years, 3; consumption 1, lung disease 2. Ripley, Miss., 1,000; no deaths. Santa Cruz, Cal., 5,000; no deaths. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; death, 1. Summit, Miss., 1,808; no deaths. Tampa, Fla., 740; death, 1. Titusville, Pa., 9,000; deaths, 5; under 5 years, 2; croup 1, lung disease 2. Tuscaloosa, Ala., 2,000; deaths, 3; diphtheria 2, lung disease 1. Winchester, Va., 5,000; deaths, 1; under 5 years, 1; lung disease 1. Winona, Minn., 10,000; deaths, 2. Youngstown, Ohio, 15,089; death, 1; under 5 years, 1; croup 1. Total population, 335,583; deaths under 5 years, 43; total number of deaths, 109; annual rate per 1,000, 16.9.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, DECEMBER 11, 1880. [No. 24.

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

NATIONAL LEGISLATION—Continued.

BY STEPHEN SMITH, A. M., M. D., of New York

Although the single section of the bill reported, and finally adopted, in 1796, was the first act of Congress relating to quarantine, a motion was made in the First Congress looking to the establishment of health officers in the several ports of the Union, as appears from the following extract from the proceedings of that body:

On the 21st of December, 1790, a committee was appointed to bring in a bill to establish health officers in the principal ports of the Union. This committee consisted of Messrs. Lawrence, of New York; Seney, of Maryland; Fitzsimmons, of Pennsylvania; Vining, of Delaware; and Goodhue, of Massachusetts.

This committee does not seem to have made any report, and the intention of the motion is, therefore, not known. Congress also, by special act, approved the act of the legislature of Maryland levying a duty on vessels to pay the expenses of its health officer.

During the summers of 1796 and 1797 the yellow fever again prevailed widely and increased the public alarm by the extension of its area and the fatality of its attacks.

On the opening of the Fifth Congress, at Philadelphia, November 23, 1797, the President, John Adams, commenced his speech to the Houses as follows: "I was for some time apprehensive that it would be necessary, on account of the contagious sickness which afflicted the city of Philadelphia, to convene the national legislature at some other place. This measure it was desirable to avoid, because it would occasion much public inconvenience and a considerable public expense, and add to the calamities of the inhabitants of this city, whose sufferings must have excited the sympathy of all their fellow-citizens; therefore, after taking measures to ascertain the state and decline of the sickness, I postponed my determination, having hopes, now happily realized, that, without hazard to the lives or health of the members, Congress might assemble at this place, where it was next by law to meet. I submit, however, to your consideration whether a power to postpone the meeting of Congress, without passing the time fixed by the Constitution, upon such occasions, would not be a useful amendment to the law of 1794."

In the address of the House in response to the speech of the President, which it was at that time customary to make, the subject is noticed as follows: "While our sympathy is excited by the recent sufferings of the citizens of Philadelphia, we participate in the satisfaction which you are pleased to express, that the duration of the late calamity was so limited as to render unnecessary the expense and inconvenience that would have been incident to the convention of Congress in another place, and we shall readily attend to every useful amendment to the law which contemplates the event of contagious sickness at the seat of government."

Congress does not seem, however, to have taken any action at this session.

During the summer of 1798 yellow fever again appeared, and this time it attained the proportions of a national scourge. It prevailed at Portsmouth, N. H.; Boston and Salem, Mass.; Westerly, R. I.; Hartford, Stonington, New London, and Norwalk, Conn.; New York; Bridgeton and Woodbury, N. J.; Philadelphia, Marcus Hook, and Chester, Pa.; Wilmington, Christina, Duck Creek, and New Castle, Del.; Baltimore, Md.; Norfolk, Petersburg, and City Point, Va.; Charleston, S. C.

At the opening of the third session of the 5th Congress, December 8, 1798, President Adams thus addressed the two Houses: "While with reverence and resignation we contemplate the dispensation of Divine Providence in the alarming and destructive pestilence with which several of our cities and towns have been visited, there is cause for gratitude and mutual congratulations that the malady has disappeared, and that we are again permitted to assemble in safety at the seat of government for the discharge of our important duties. But when we reflect that this fated disorder has within a few years made repeated ravages in some of our principal seaports, and with increased malignancy, and when we consider the magnitude of the evils arising from the interruption of public and private business, whereby the national interests are deeply affected, I think it my duty to invite the legislature of the Union to examine the expediency of establishing suitable regulations in aid of the health laws of the respective States; for, these being formed on the idea that contagious sickness may be communicated through the channels of commerce, there seems to be a necessity that Congress, who alone can regulate trade, should frame a system which, while it may tend to preserve the general health, may be compatible with the interests of commerce and the safety of the revenue."

Petitions were prepared to be laid before Congress, both in Philadelphia and New York, asking aid of the general government. The Philadelphia committee went so far as to propose non-intercourse with the West India ports during the dangerous months of the season. The New York committee objected to such stringent measures, and a modified memorial was adopted. The health officer of New York, Dr. Richard Bayley, urged the formation of quarantine establishments at a proper distance from seaport cities, where ships could be examined and, if necessary, thoroughly cleansed and disinfected.

The subject was again brought before Congress by Mr. Smith, of Maryland, who was now chairman of the Committee of Commerce, as appears from the following extract from the Annals of Congress:

"On Wednesday, January 23, 1799, Mr. Smith, of Maryland, from the Committee of Commerce, reported a bill respecting quarantine and health laws, which was read and committed.

"On Monday, January 28, 1799, on motion of Mr. Smith, of Maryland, the House went into a committee of the whole, on the bill respecting quarantine and health laws; Mr. Rutledge in the chair.

"The bill was read as follows:

"SECTION 1. *Be it enacted, &c.*, That the quarantine and other restraints which shall be required and established by the health laws of any State, or pursuant thereto, respecting any vessel arriving in, or bound to, any port or district thereof, whether from a foreign port or place, or from another district of the United States, shall be duly observed by the collectors, and all other officers of revenue of the United States, appointed and employed for the several collection districts of such States respectively, and by the masters and crews of the several revenue cutters, and by the military officers who shall command in any port or station upon the sea-coast; and all such officers of the United States shall be, and they hereby are, authorized and required faithfully to aid in the execution of such quarantine and health laws, according to their respective powers and precincts, and as they shall be directed from time to time by the Secretary of the Treasury. And the said Secretary shall be, and is hereby, authorized, when a conformity to such quarantine and health laws shall require it, and in respect to vessels which shall be subject thereto, to prolong the terms limited for the entry of the same, and the report or entry of their cargoes, and to vary or dispense with any other regulations applicable to such reports or entries: *Provided*, That nothing herein shall enable any State to collect a duty of tonnage or impost without the consent of the Congress of the United States; *And provided*, That no part of the cargo of any vessel shall, in any case, be taken out or unladen therefrom otherwise than as by law is allowed, or according to regulations hereinafter established.

"SEC. 2. *And be it further enacted*, That when, by the health laws of any State, or by the regulations which shall be made pursuant thereto, any vessel arriving within a collection district of such State shall be prohibited from coming to the port of entry or delivery by law established for such district, and it shall be required by such health laws that the cargo of such vessel shall, or may be, unladen at some other place within or near to such district, the collector authorized therein, after due report to him of the whole of such cargo, may grant his special warrant or permit for the unloading and discharge thereof, under the care of the surveyor, or of one or more inspectors, at some other place where such health laws shall permit, and upon the conditions and restrictions which shall be directed by the Secretary of the Treasury, or which such collector may, for the time, reasonably judge expedient for the security of the public revenue: *Provided*, That in every such case all of the articles of the cargo so to be unladen shall be deposited, at the risk of the parties concerned therein, in such public or other warehouses or inclosures as the collector shall designate, there to remain under the joint custody of such collector and of the owner or owners, or master or other person having charge of such vessel, until the same shall be entirely unladen or discharged, and until the goods, wares, or merchandise which shall be so deposited may be safely removed, without contravening such health laws; and when such removal may be allowed, the collector having charge of such goods, wares, or merchandise may grant permits to the respective owners or consignees, their factors or agents, to receive all goods, wares, or merchandise

which shall be entered and whereof the duties accruing shall be paid or secured according to law, upon the payment by them of a reasonable rate of storage, which shall be fixed by the Secretary of the Treasury for all public warehouses and inclosures.

"SEC. 3. *And be it further enacted*, That there shall be purchased or erected, under the orders and with the approbation of the United States, suitable warehouses, with wharves and inclosures, where goods and merchandise may be unladen and deposited, from any vessel which shall be subject to a quarantine, or other restraint, pursuant to the health laws of any State as aforesaid, at such convenient place or places therein as the safety of the public revenue and the observance of such health laws may require: *Provided*, That the sites of all such warehouses and wharves, with such other adjoining lands as may be necessary for the public uses hereby authorized, shall be ceded to the United States by the State wherein the same shall be.

"'SEC. 4. *And be it further enacted*, That when by prevalence of any contagious or epidemical disease in or near the place by law established as the port of entry for any collection district, it shall become dangerous or inconvenient for the collector and other officers of the revenue employed therein to continue the discharge of their respective offices at such port, the Secretary, or in his absence, the Comptroller of the Treasury of the United States, may direct and authorize the removal of the collector, and the other officers employed in his department, from such port to any other more convenient place within, or as near as may be to such collection district, where such collector and officers may exercise the same authorities, and shall be liable to the same duties, according to existing circumstances, as in such lawful port or district; and of such removal, public notice shall be given as soon as may be.'"

The following discussion ensued:

"Mr. Livingston, of New York, moved to strike out the proviso at at the close of the third section, as it might, in his opinion, be productive of delay in some cases, and of danger in others. Some of the State legislatures might not be in session before the evil intended to be guarded against returns upon us, and it might interfere with the jurisdiction of towns or cities, of which those sites form a part. He knew that there were some gentlemen in the House who think no money ought to be expended by the United States for any public works until cessions of the jurisdiction are made. This may be proper, with respect to forts and magazines with which State jurisdiction might interfere; but this being merely a civil jurisdiction, and so far from interfering with any State jurisdiction, is to co-operate with the State regulations, gentlemen may vote for striking out this clause, without parting with their favorite doctrine.

"Mr. Dayton, of New Jersey, trusted the motion would not prevail. It was negatived, there being only 23 votes in favor of it.

"Mr. Livingston, of New York, then moved to amend the bill by striking out the second line of the third section with the words "and with approbation," which was certainly surplusage. Agreed to.

"Mr. Walu, of Pennsylvania, said if it were proper to cede the land on which the warehouses are built, he did not think it would be to cede the sites of wharves to the United States. He did not think it right, for instance, to cede the jurisdiction of any wharves which might be built in the vicinity of this city to the United States. He, therefore, moved to strike out the words "and wharves."

"Mr. Sewall, of Massachusetts, hoped the gentleman from Pennsylvania would not insist upon this motion. No wharves would be erected where wharves now are; and if the United States are at the expense of erecting wharves, they ought to have the jurisdiction of their sites, as well as of the sites of warehouses.

"This motion was negatived, there being only 12 votes for it.

"The committee rose and reported the bill, when Mr. Harper renewed the motion for striking out the proviso in the third section, for the reasons he urged in support of the former motion, and because this cession would be of no use to the United States; and after some few observations upon it, the motion was carried, 40 to 31.

"On motion of Mr. Sewall, of Massachusetts, the following section was added, repealing a law of the first session of the Fourth Congress, respecting quarantine:

"'SEC. 5. *And be it further enacted*, That the act entitled 'An act relative to quarantine,' passed in the first session of the Fourth Congress of the United States shall be, and the same is hereby, repealed.'"

January 29, 1799, the bill was read a third time and passed.

In the Senate an additional section was added, as follows:

"SEC. . *And be it further enacted*, That, whenever, in the opinion of the Chief Justice, or, in case of his death or inability, of the senior associate justice of the United States, a contagious sickness shall render it hazardous to hold the next stated session of the said court at the seat of government, it shall be lawful for the Chief or such associate justice to issue his order to the marshal of the district within which the Supreme Court is by law to be holden, directing him to adjourn the said session of the said Court to such other place within the same, or an adjoining district as he may deem convenient; and the said marshal shall thereupon adjourn the said court by making publication thereof in one or more public papers printed at the place by law appointed for holding the same, from the time he shall receive such order, until the time by law prescribed for commencing the said session. And the district judges shall, respectively, under the same circumstances, have the same power, by the same means, to direct adjournment of the district and circuit courts within their several districts, to some convenient place within the same, respectively."

This amendment was concurred in by the House, and the bill, as amended, was passed.

It was approved February 25, 1799.

In 1799–1800 there was much alarm in Europe in regard to the spread of the plague, and stringent quarantine measures were adopted by the British Government. There was some apprehension that the pestilence would be imported into this country, and Congress was urged to consider the question. On Friday, February 28, 1800, Mr. Walu, of Pennsylvania, presented a memorial from the health office in Philadelphia, stating that in consequence of the plague having raged in Morocco, Great Britain had enacted very strict quarantine laws, but although the port of Philadelphia might be watched by all the vigilance in the power of the health office there was no general law to keep that most dreadful scourge of the human race from being introduced into some ports of the United States. They prayed the attention of Congress thereto. Referred to the Committee of Commerce.

Wednesday, March 19, 1800, a memorial of the select and common councils of the city of Philadelphia was presented to the House and read, praying that Congress may take such precautionary measures to prevent the introduction of the plague, which has for some time prevailed in the countries bordering on the Mediterranean, as to their wisdom shall seem meet. Referred to the Committee on Commerce and Manufactures.

Friday, April 25, 1800, the Speaker laid before the House a letter from the Secretary of the Treasury, accompanying an estimate for an appropriation of moneys for carrying into effect the act respecting quarantine and health laws, which were read and ordered to lie on the table. No other action was taken, nor was the subject alluded to for upwards of two years.

On Friday, January 8, 1802, Dr. Samuel L. Mitchell, of New York, now for the first time a member of the House of Representatives, offered the following resolution:

"*Resolved*, That a committee be appointed to inquire and report whether any, and what, alterations are necessary to be made in the 'act respecting quarantine and health laws.'"

It was ordered that Mr. Mitchell, of New York; Mr. Eustis of Massachusetts; Mr. Leib, of Pennsylvania; Mr. Archer, of Maryland; Mr. Lowndes, of South Carolina, be appointed a committee pursuant to the said resolution.

Dr. Mitchell was an active participant in the medical controversies in regard to the origin of yellow fever in New York. He was a strong advocate of non-contagion, and believed that pestilential diseases were frequently engendered on board of filthy ships. He did not, therefore, believe in quarantines for detention simply, but only for purification of ships. He was also an ardent believer in the efficacy of alkalies as an antidote to septic poisons, and hence advocated alkalies, vigorously applied, instead of fumigation.

In a letter to Dr. Richard Bayley, the health officer of New York, dated July 1, 1801, he concludes a history of quarantines with the following statement of his views:

"Vessels retain the pestilential because (1) from their structure it is difficult to introduce a sufficiency of fresh air to waft away the infectious gas; (2) from the manner of their construction it is also exceedingly difficult to scrub and scour and cleanse them by lime and alkalies, as houses are purified; and (3) from the preposterous custom of pronouncing a vessel clean after she has been pumped out and fumigated with tar and brimstone; while, in fact, she is as foul *after* being smoked as she was *before*. The negligence of navigators and owners of vessels on these points renders it absolutely necessary for public authority to interfere. All that I think necessary in the business is that the never-failing method of *house-cleaning* should be applied to *ship-cleaning* in the way that you have adopted with such happy success. And if the time shall arrive when sea-vessels shall be kept as clean as genteel habitations on shore, their crews and passengers will suffer as little by infection and pestilence; and then the dream of importing diseases from foreign countries will be forgotten or insisted on no more as a reality. And that this is not a mere conjecture but a practical fact is confirmed by the experience of the Dutch navigators; for they, carrying with them to sea the habits of that precise and unequaled cleanliness which prevails on shore in the United Netherlands, are rarely or never troubled with the fevers, the plagues, and the infectious distempers which incessantly harass the nastier nations of the earth."

The special object which Dr. Mitchell had in view in offering the above resolution seems to have been to give publicity to his opinions in regard to the virtues of alkalies as an antidote to septon (septic poisons). He says:

"The particular object aimed at is to cleanse ships and vessels by means of *alkaline salts and lyes*, and to explode the miserable and delusive practice of fumigation; in short, to apply the modes of *cleaning houses to the purification of ships*. This will reduce the quarantine of vessels *to the simple process of cleaning by alkalies*, and eventually remove from commerce most of the tedious and burdensome restraints under which it is now groaning. Science will have a glorious triumph, and the American Government will set a noble and liberal example to the whole civilized world."

On Tuesday, March 9, 1802, the following petition was referred to that committee:

"A petition of sundry merchants residing in the city and State of New York, importers of cotton, hides, and other raw materials, for manufacture, was presented to the House and read, stating that the inconveniences and expense to which the petitioners are subjected by being obliged, under the quarantine laws of the said State, to unload and deposit for a limited time in every year, the said articles on Staten Island, and praying that they may be permitted to keep the same in the public storehouse of the United States erected on the island aforesaid, free from storage, during the period of such quarantine."

"*Ordered*, That the said petition be referred to the committee appointed on the 8th of January."

The committee made no report at that session.

At the following session it appears that on the 15th of February, 1803, the House referred to that committee the following resolution: "That provision ought to be made by law for the regulation of quarantine within the District of Columbia." Finally, on the 25th of February, 1803, William Mitchell submitted his report, which is remarkable for its intelligent recognition of the unhealthfulness of ships, and the better methods of purification. The report is as follows:

The term "quarantine" has been used, in the commercial world, to denote the detention of ship or vessel at a convenient place, some distance from port, for the space of forty days, for the purpose of freeing her from contagion and infection, supposed to have been transported in her from foreign places; latterly it means any shorter number of days. Under the persuasion that their own cities and habitations were exempt from such contagion and infection, and that these destructive agents were always introduced from remote places, less salubrious than their own, mankind have taken great pains to protect themselves from external attacks of the distempers which they believed to be prevalent among their neighbors or strangers. By the presumption that contagion was frequent in many foreign settlements, and was readily transported from country to country by commercial communications, have the nations of the earth been influenced in framing the rules and the means of restraint imposed upon their mutual intercourse. They have often looked upon each other as lazars or lepers, and treated visitors and passengers at certain seasons as such.

The importance of the subject, as well to the commerce and revenue of the United States as to the happiness and security of her citizens, has induced your committee to look into it carefully. They have endeavored to gather facts and to deduce therefrom correct conclusions; and, upon the most complete investigation which they have been able to give the subject, they are decidedly of the opinion that the ideas generally entertained concerning quarantines are very erroneous.

It is true that certain diseases which afflict mankind, such as small-pox, for example, may be transferred from one person to another; but of late doubts have been entertained in the minds of some of the best observers, of such as have had great opportunities of knowing and judging, whether the like contagionsness is true of yellow fever and the fever infecting ships.

Sickness of distant places and the danger arising from any intercourse with them is one of the trite themes of remark almost everywhere. At the same time few people can be brought to acknowledge the noxionsness of the soil and atmosphere of the place of their permanent residence. Therefore the inhabitants of the West India Islands are positive that they import yellow fever from Boston, New York, Philadelphia, and Baltimore; while the inhabitants of those cities, respectively, have been quite as decided in their conviction that the same distemper is brought to them from Cape François, Kingston, Havana, and Demerara. Both sides are equally positive, and both about equally wrong. During the 700 or 800 years since the days of the crusades these erroneous sentiments have been indulged in Christendom. Great embarrassments have been experienced from them; and at this day they seem to be increasing. It is an object worthy the attention of the national legislature, to correct within these States this growing evil.

It is apparent to your committee that most, if not all, the infectious diseases which at times afflict the crews of sea vessels arise *not* from the ports or countries they have visited but from causes which exist *within* the *vessel*. Human beings inhabiting such crowded situations engender and communicate diseases which increase in frequency and malignity by sloth and uncleanness. Now, a ship is a human habitation, and sometimes the crew is very numerous, and usually prone to grow unclean. Frequently this uncleanness accumulates to a disgusting degree and turns to poison. The poison stirs up pestilence. Arrivals from Europe have given recent and woful proofs of this.

But a ship is not merely a human dwelling; she is also a magazine or storehouse. Within her sides, as in a common receptacle, are collected many sorts of things prone to perish and corrupt.

Beef, fish, pork, hides, and other animal substances frequently taint the hold that contains them with their deleterious vapors. This tendency to putrefy is often increased by the scanty quantity and weak quality of the Liverpool salt with which they are put up. Their provision spoiling during the West India voyages, and rotting on shipboard (which is a well-known case in hot climates), render the berths and quarters of the men unhealthy, the crew sickens from the operations of such mischievous agents, and some of them are soon destroyed. The evil is increased when they are obliged to feed on such tainted or spoiled meat as a part of a daily ration. Not only animal substances, but onions, coffee, Indian corn, and various other vegetables, which are transported from country to country, contribute, by their occasional decay, to render unhealthy the bottoms in which they are carried. From these causes it is well known that provisions carried between our ports and the southern islands degenerate, and frequently the vessels conveying them are found in a very filthy and unclean condition. From the corruption of their cargoes and the uncleanness of the crews, ships may be filled with a venomous atmosphere, and the timbers, planks, bedding, &c., be charged or impregnated with the inbred mischief. Many ships belonging to the United States afford instructive examples of fevers caused on board by the exhalations from putrid provisions on their outward-bound voyages. A corrupting barrel of beef has done great injury within a vessel sailing from Great Britain to the United States.

It is a remarkable fact that ships and vessels, though so prone to become foul and pestilential, are seldom cleansed in so complete a manner as they ought to be. From the time that they are launched to the day of their condemnation few or none of them are perfectly purified. Year after year this foulness increases, insomuch that old ships and vessels are usually the most nasty and loathsome of human habitations.

Ships being thus, from their structure, tenants, and cargoes, peculiarly liable to accumulate poison, and being rarely or never cleared out, as they ought to be, carry that infectious matter engendered within them to all parts of the world; and by a curious and unhappy mistake the pestilence produced in one of these floating mansions has been almost always referred to the place from which she last came, though that place commonly has not had any kind of agency in the matter.

Hence, it will appear to every reflecting mind that the common mode of quarantine by detaining a foul ship at anchor will rather increase than remedy the evil intended to be guarded against. Bills of health are ungatory or deceitful; for if a clean ship sails from a sickly place a foul bill of health will not really indicate an unfavorable state of health on board, nor prove the crew to be affected with the distemper that prevails in the port she left; nor will a clean bill that the people in a pestilential vessel are in good health or that she is in a safe or fitting condition to be admitted to port. Consequently, bills of health are either useless or worse than nothing. With the Dutch, who are remarkable for clean ships, and who carry the system of purification on board their vessels to a greater extent than any other nation of Europe, quarantine is a mere form only. Pestilence can neither be bred nor continued on board the vessels of the Hollanders.

Instead of the rigorous rules of quarantine adopted in the United States, your committee are of opinion the mischiefs intended to be guarded against thereby might be more effectually prevented by less injurious means. It is remarkable how little pains are taken to accomplish the complete and healthy purification of ships. None of the regulations which have hitherto been made direct the method of performing it or insist upon it with sufficient energy. A ship cannot be deemed wholesome or fit for a voyage merely because the hold and windows have been opened after she is unloaded, her decks washed and scraped, and the bilge-water pumped out. Nor will the smoking her out with brimstone, tar, or nitrous and muriatic vapors render her a suitable habitation to preserve the health and lives of men. As well might it be pretended that infected rooms, beds, and clothes could be purified by merely letting in the air and setting fumigating mixtures into action: when all domestic experience teaches that soap, lye, and lime are the only sure and efficacious auxiliaries in all cases of difficulty and danger.

It is a lamentable fact that, under the present quarantine regulations, in most places so little regard is paid to cleaning a fœtid and infectious ship, provided she does not transgress the rules *of the port where she happens to be*, by proceeding beyond her prescribed limits. She may, nevertheless, weigh anchor and go, in her foul condition, to *any other port or city* without the least impediment. By this miserable practice is the poison of plague, pestilence, or yellow fever produced, continued, and multiplied, by natural and necessary process, on shipboard, and carried to all the places she visits; and while this dreadful custom prevails, there will not probably be an end of the rumors of imported contagion, and all the consequent terror and stagnation of business at home and of detention of ships and expense of quarantine abroad. The recent accounts of the severe quarantine of a hundred days and more imposed upon American vessels in some of the principal ports of Spain, must fill every friend of our country with regret. It amounts to an almost total prohibition of our trade with those cities, and is viewed by your committee as countenanced by false alarms and unfounded suggestions prevalent among our own citizens. In order to prevent these commercial restraints, in some degree, it is necessary to form our health laws upon more scientific principles, and to regulate our marine and naval intercourse upon maxims more accordant with the means to preserve domestic neatness and household purity on shore.

Considering the great influence of names over human thought and action, and the high importance of a correct nomenclature for legal and scientific purposes, it were to be wished that the term quaran-

line should be erased from the statute-books of the Union and of each particular State. Instead of ordering a vessel *to perform a quarantine*, she ought *simply to be directed to be made clean*. Such foul and infectious vessels, with sickly crews, should be prevented from coming to our cities or proceeding on any voyage in that situation. Nor is the matter so difficult of execution as many have imagined. When a vessel arrives from any foreign port, let her come to at some convenient place. If any are sick on board, let them be landed and all uncleanness put away. If she has any spoiled and putrefied provisions or merchandise on board, let them also be taken out. Then cause her to be scoured and cleaned in every part with pure water, soap, sand, alkaline, lye, lime, and other sweetening and purifying substances; after which the admission of a plenty of clean and good air will complete the work. These are the methods we use with success to cleanse our habitations on the land. They are equally applicable to habitations on the water, and it is necessary to scour the latter as frequently and as thoroughly as the former. But as individuals who own and navigate vessels are too careless or forgetful to cause them to be frequently and efficaciously cleansed, there is a necessity for public authority to interfere. This interference should be exerted to purify every foul and pestilential vessel that enters a port, and not keep her idly and injuriously riding at anchor. Quarantines may thus be shortened from forty days to *forty hours. Indeed, they would be nothing more than a thorough ship-cleaning.*

When the civilized world shall, with one accord, enforce the regular and exact purification of ships, there will be nothing on board to turn to pestilential or any other fever-producing agent, and all the inquiry necessary, when a vessel arrives, will be whether she is clean or dirty. As the latter is almost always the fact, she should be cleansed by public authority, and never suffered to go to sea, no more than enter a port, in a foul internal condition. There would then be no vessels afloat carrying infection with them from place to place, and the tales about contagion from foreign ports would gradually die away and cease to agitate society, as they now do, to the great detriment of our trade, and disgrace of commerce, medicine, and police.

After taking this comprehensive view of the subject, it would have been pleasing to the committee to have proposed something more in detail for the treatment of vessels arriving at the port of Alexandria, conformably to these principles, but the advanced period of the session prevents their offering more at this time to the House. They content themselves, therefore, for the present, with calling attention to this important subject and presenting for adoption, as a temporary expedient, a bill for extending the quarantine laws of Virginia to the territory of Columbia.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough reports that, for the three weeks ending October 23, dysentery and malarial fevers were the prevailing diseases in that town. This is a very usual occurrence during the summer months, and the spread of the diseases is anticipated. The sanitary condition of the city is not good, owing to the absence of drainage and want of cleanliness.

BORDEAUX, FRANCE.—United States Vice-Consul L. A. Price reports that, during the month of October, there were 455 deaths; 8 were from small-pox, 6 from typhoid fever, 31 from pneumonia, 21 from consumption, 14 from pulmonary catarrh, 7 from bronchitis, 11 from accidents, and 2 from suicide. Sanitary condition of city is good.

CALCUTTA, INDIA.—United States Vice-Consul-General A. B. Cobb reports that, of the 195 deaths that occurred during the week ending October 2, there were 46 from fever, 16 from bowel complaints, 36 from tetanus, 11 from phthisis, 9 from heart diseases, from spleen and liver diseases 12, and from paralysis 2.

For the week ending October 9 there were 210 deaths, of which 55 were from fever; bowel complaints, 23; tetanus, 33; phthisis, 7; heart disease, 5; liver and spleen diseases, 12; convulsions, 9; accidents, 7.

FOOCHOW, CHINA.—United States Consul J. A. Wingate reports that the sanitary condition of the native portion of the city is very bad; that of the foreign settlement good. The drainage of the city is very poor, and the streets and habitations are very filthy.

MARSEILLES, FRANCE.—United States Consul J. B. Gould reports that during the month of October there were 213 deaths, of which 43 were from small-pox, 52 from typhoid fever, and 3 from other contagious or infectious diseases.

NINGPO, CHINA.—United States Consul Edward C. Lord reports that, for the five weeks ending October 23, the prevailing diseases have been diarrhœa, dysentery, ague, common and typhoid fevers, cholera, diseases of the lungs, heart, kidneys, &c. Measles, whooping cough, scarlet fever, &c., were also more or less common. Fevers were the most numerous, some few cases of which were fatal.

The following reports, for the week ending November 27, are from places in which burial permits are not required:

Alexandria, Va., 13,000: deaths, 9; under 5 years, 2; consumption 2, diphtheria 1, lung disease 1. Allegheny, Pa., 78,000; deaths, 16; under 5 years, 8; consumption 1, croup 1, diphtheria 1, enteric fever 1, scarlet fever 3, lung disease 1, measles 2. Brattleboro', Vt., 6,000: deaths, 4; consumption 1, enteric fever 1. Bucyrus, Ohio, 3,350; death 1. Carrollton, Miss., 600: no deaths. Chillicothe, Ohio, 11,000; deaths, 2; under 5 years, 1; lung disease 1. Corinth, Miss., 2,261: deaths, 3; puerperal 1. Crystal Springs, Miss., 955: death, 1; under 5 years, 1. Dallas, Tex., 10,365; deaths, 2; lung disease 2. Decatur, Miss., 1,000; no deaths. Dixon, Cal., 1,200: death, 1; pneumonia 1. Helena, Mont., 3,630: deaths, 3; under 5 years, 2; diphtheria 2, whooping cough 2. Hernando, Miss., 1,000; no deaths. Huntingdon, Tenn., 1,200; death, 1; consumption 1. Indianola, Tex., 900; death, 1, consumption 1. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,351; deaths, 3; under 5 years, 2; croup 1, puerperal 1. Kenosha, Wis., 5,500; deaths, 2; under 5 years, 1. Lebanon, Pa., 9,000; deaths, 2; accident 1. Louisiana, Mo., 5,200; death, 1; under 5 years, 1; measles 1. Madison, Ind., 9,009; deaths, 2; consumption 1. Martinsburg, W. Va., 5,800; deaths, 3; consumption 1, lung disease 1. Meridian, Miss., 4,013; deaths, 2. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; no deaths. Monmouth, Ill., 6,000; deaths, 2; under 5 years, 1; croup 1; lung disease 1. Montgomery, Ala., 17,000; deaths, 7; under 5 years, 1. croup 1, diphtheria 1, enteric fever 2, puerperal 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; deaths, 3; consumption 1. Muscatine, Iowa, 8,412; deaths, 2; under 5 years, 2; scarlet fever 1, accident 1. Niles, Mich., 1,100; no deaths. Okaloma, Miss., 2,000; no deaths. Painesville, Ohio, 5,601; no deaths. Pearlington, Miss., 1,200; death, 1; consumption 1. Phœnixville, Pa., 6,692; deaths, 2; under 5 years, 2; diphtheria 2. Pleasant Hill, Miss., 253; death, 1. Plymouth, Mich., 3,000; death, 1. Rock Island, Ill., 12,000; deaths, 6; under 5 years, 4; croup 1, diphtheria 1, scarlet fever 2, lung disease 1. Santa Cruz, Cal., 5,000; no deaths. Starkville, Miss., 1,451; no deaths. Steubenville, Ohio, 13,500; deaths, 5; under 5 years, 2. Sumner, Miss., 1,808; deaths, 2; under 5 years, 2; diphtheria 2. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; death, 1. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; deaths, 7; under 5 years, 7. Youngstown, Ohio, 15,089; deaths, 2; under 5 years, 1; accident 1. Total population, 314,395; deaths under 5 years, 31; total number of deaths, 99; annual rate per 1,000, 16.1.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

Under date of December 2 the Hon. W. Hunter, Second Assistant Secretary of State, informs the National Board of Health that the Government of the Argentine Republic, by a decree of the 11th of October last, designated Señor Don Julio Carrie as charge d'affaires *ad interim* in Washington as its representative at the International Sanitary Conference.

Dr. Harry O. Perley, assistant surgeon, U. S. A., under date of November 23, reports that a case of measles occurred on the 21st instant at the post of Fort Assiniboine, Montana Territory. The patient, a young Gros Ventre squaw, contracted the disease from a passing band of Northern Cree Indians. She is now at the Indian interpreter's house, and all communication with the house has been stopped. He states that every precaution has been taken to prevent the spread of the disease.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

Countries.	Places.	Population.	Week ending—	Total deaths.	Annual rate per 1,000.	Cholera.		Yellow fever.		Small-pox.		Typhoid fever.		Typhus fever.		Other contagious diseases.		Weekly mean of thermometer.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, DECEMBER 18, 1880. [No. 25.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

Under date of December 7, the Hon. William M. Evarts, Secretary of State, informs the National Board of Health that the minister of the United States at Caracas reports, in his dispatch of the 15th ultimo, that Señor Don Simon Comacho, chargé d'affaires of Venezuela in this country, has been authorized to assist at the conference in the character of delegate thereto, and that Señor Comacho is invested with suitable powers in the premises.

He also states that he is in receipt of a note dated the 4th instant, from Señor Comacho, informing him of his appointment.

Hon. John Hay, Assistant Secretary of State, under date of December 8, informs the National Board of Health that, according to a dispatch from Madrid, orders have been given to the governor-general of the island of Cuba to designate a person who, besides being a graduate in medicine and surgery, is also conversant with the sanitary condition of that island and of Porto Rico, to represent those islands, in conjunction with the Spanish minister in this country, at the proposed International Sanitary Conference.

He also states that the government of Italy accepts the invitation of the United States to be represented at the conference, trusting, however, that the date of assembling may be postponed. He states that a telegram will be sent to the minister of the United States at Rome to the effect that the date proposed cannot now be changed.

Also, under date of December 10, states that the Austro-Hungarian Government has named Count Edmund Bethlen as its delegate to the International Sanitary Conference of January next.

The Japanese minister, resident in this city, will represent the Japanese Empire in the International Sanitary Conference to be held on the 1st proximo.

ABSTRACTS FROM CONSULAR REPORTS.

AUCKLAND, NEW ZEALAND.—United States Consul G. W. Griffin forwards registrar general's report on vital statistics for principal towns of New Zealand for the month of September. The total number of deaths was 164, of which 90 were under 5 years of age. The deaths comprised 2 from diphtheria, 2 from croup, 3 from whooping-cough, 7 from phthisis, and 13 from lung diseases.

CALCUTTA, INDIA.—United States Consul A. B. Cobb reports that of the 239 total deaths during the week ending October 16, 24 were from cholera, 7 from typhoid fever, other fevers 67, bowel complaints 23, tetanus 25, phthisis 7, heart diseases 13, liver and spleen diseases 8. Annual death-rate per 1,000, 29.0.

For the week ending October 23 there were 279 deaths, of which 22 were from cholera, 9 from typhoid fever, other fevers 86, bowel complaints 30, tetanus 32, phthisis 5, heart diseases 13, liver and spleen diseases 18. Annual death-rate per 1,000, 33.8.

CAPE OF GOOD HOPE, CAPE TOWN.—United States Consul W. W. Edgecomb, in his report for the week ending November 1, states that the summer season has now fairly set in, and the southeasterly winds, known as the "cape doctor," have commenced to blow furiously. The general health of the town and district is good, but the supply of water for drinking and household purposes is failing daily, and unless there is rain soon there will be a water famine in the town before the end of the year.

CONSTANTINOPLE, TURKEY.—United States Consul-General G. H. Heap, under date of November 15, forwards bulletins of epizootic diseases.

From these it appears that a disease which is reported the cattle plague has broken out in the vicinity of d'Ordou.

At Pergame and Tira, districts of Smyrna, sheep-rot is prevailing.

The disease among horses at Hedjaz has entirely disappeared, and also the carbuncle disease at Bursum and Carnabeili.

He also states that the sanitary condition of the empire is otherwise satisfactory, no epidemic being reported in any quarter.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webste reports that during the month of August there were 46 deaths, of which 2 were from infectious diseases.

HONOLULU, SANDWICH ISLANDS.—United States Consul F. P. Hastings forwards mortuary report for month of October. The total number of deaths was 51; 30 males and 21 females. The principal causes of death were consumption 6, convulsions 4, debility 7, old age 7.

MALAGA, SPAIN.—United States Consul H. C. Marston, in forwarding his first reports, gives the following in regard to the sanitary condition of the city. In the old portion of Malaga the streets are exceedingly narrow, some of them not exceeding fifteen feet in width, and only on certain streets can a conveyance of any kind be driven. These narrow streets are paved with large bowlders and are kept tolerably free from dirt, but the drainage from the dwellings is very bad, and in almost every house the smell from the drain, together with the smell of a very inferior quality of oil used by the lower classes in cooking, is beyond description. The fact that Malaga escapes an epidemic can only be attributed to the excellence of the climate.

MONTEVIDEO, URUGUAY.—United States Consul A. L. Russell reports that during the month of September there were 261 deaths, of which 6 were from typhoid fever, heart diseases 26, diseases of brain and spine 27, diseases of liver 7, consumption 54, laryngitis 5, of digestive organs 16, genital organs 10, unknown 23; died without medical attendance 70.

He also states that there are no cases of contagious or infectious diseases known nearer than Flores Island, 18 miles from the city, where Her Brittanic Majesty's ship Garnet arrived from Brazil and was quarantined, several weeks ago, with 5 cases of yellow fever on board, but all now reported well.

NASSAU, N. P., BAHAMAS.—United States Consul Thomas J. McLain, jr., reports, under date of December 4, that there has been no yellow fever since October 1. The town is remarkably healthy, and its sanitary condition excellent.

SYDNEY, NEW SOUTH WALES.—During the month of September there were 240 deaths, being 77 above the 5 years' average. The principal causes of death were cephalitis 8, apoplexy 4, convulsions 12, heart disease 10, bronchitis 22, pneumonia 17, congestion of lungs 6, measles 40, whooping-cough 5, croup 4, typhoid fever 6, diarrhœa 5, dropsy 5, cancer 7, phthisis 16. Of the deaths from measels 35 were under 5 years of age.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—During the week ending December 3 there were 6 deaths from yellow fever and 8 deaths from small-pox. During the month of November there were 26 deaths from yellow fever, 16 of which were among civilians, and ten in the military hospitals. There were also 55 deaths from small-pox.

Dr. John T. Nagle, health officer of the city of New York, submits the following report for the third quarter of 1880:

SIR: Eight thousand four hundred and twenty-three deaths occurred in the city of New York during the three months ending September 30, 1880. This is an increase of 737 deaths when compared with the corresponding quarter of the year 1879, and a decrease of 209 when compared with the preceding three months, and represents an annual death rate of 27.92 to every 1,000 of the population, which

was 1,206,577 according to the United States census which was taken in June, 1880.

The mean meteorological observations for the quarter, according to the report of D. Draper, director of the New York Meteorological Observatory, Central Park, are as follows, viz: July, 74.90; August, 72.65; September, 67.10. The mean humidity (saturation being 100) for July was 72; August, 76; and September, 72. The number of miles traveled by the wind in July was 42.76; August, 44.42; and September, 46.55. The total depth of rainfall for July was 3.53 inches; August, 5.26; and September, 1.85 inches. This shows an increase of temperature during the third quarter of this year, compared with the corresponding quarter of 1879, of 1.43° Fahrenheit. The rainfall was 1.74 inches greater, and the number of miles traveled by the wind was 19.62 more, while the reading of the barometer was very slightly higher.

The deaths from the zymotic class of diseases showed a more perceptible fluctuation during the quarter than any of the other classes. In July there were 1,564 deaths from zymotic diseases, while the deaths from this class of diseases were but 751 in September; or, in other words, the mortality from zymotic diseases was 50.45 daily during the month of July, and but 25.03 in September. The mean temperature, Fahrenheit, however, was 7.80 degrees higher in July than September.

The mortality of this city is usually the highest during the third quarter of the year. This is verified by the accompanying table, by quarters, for the past nine years. The present year has been an exception to this rule, the second quarter having exceeded the third by upward of 200 deaths.

Quarters.	1871.	1872.	1873.	1874.	1875.
First	6,555	7,510	6,967	6,552	7,842
Second	6,597	8,824	6,605	6,542	7,064
Third	7,924	9,958	9,018	8,625	9,256
Fourth	5,900	6,355	6,494	7,008	6,547
Total	29,976	32,647	29,084	28,727	30,709

Quarters.	1876.	1877.	1878.	1879.	1880.
First	7,633	6,602	6,664	7,576	6,814
Second	6,704	6,047	6,334	6,606	8,632
Third	8,995	8,165	7,645	7,686	8,423
Fourth	5,817	5,989	6,365	6,474	.....
Total	29,152	26,202	27,008	28,342	.....

The most prominent causes of death during the third quarter of this year were diarrhœal diseases, which carried off 2,171 persons. Of this number but 279 were over 5 years of age. Phthisis pulmonalis caused the next highest number of deaths, 1,141; diseases of the brain and nervous system, 709; pneumonia, 369; Bright's disease and nephritis, 337; diphtheria, 311; marasmus and scrofula, 262; diseases of the heart, 241; bronchitis, 203. These nine causes produced 5,744 deaths, or 68.19 per cent. of the entire mortality.

Compared with the corresponding three months of 1879, the deaths from the following diseases showed an increase, viz: Diphtheria, 210; croup, 72; typhoid fever, 19; diarrhœal diseases, 86; phthisis pulmonalis, 175; bronchitis, 17; pneumonia, 60; diseases of the brain and nervous system, 45; Bright's disease and nephritis, 35; suicide, 14; drowning, 11. And the following a decrease, viz: Small-pox, 9; measles, 35; scarlatina, 105; whooping cough, 23; typhus fever, 2; puerperal diseases, 3; cancer, 3; diseases of the heart, 15; marasmus and scrofula, 8; and hydrocephalus and tubercular meningitis, 6. In comparison with the preceding three months of the present year there was an increase of 2 deaths from small-pox, 93 from diphtheria, 3 from whooping cough, 35 from typhoid fever, 822 from diarrhœal diseases, 31 from phthisis pulmonalis, 92 from marasmus and scrofula; and a decrease of 27 deaths from measles, 43 from scarlatina, 31 from membranous croup, 1 from typhus fever, 58 from puerperal diseases, 8 from alcoholism, 10 from cancer, 68 from bronchitis, 509 from pneumonia, 41 from diseases of the heart, 41 from marasmus and scrofula, 49 from Bright's disease, 19 from suicide, and 25 from drowning.

The number of deaths in tenement houses (houses which contain more than three families) during the quarter was 4,936; in institutions, 1,423; and in hotels and boarding-houses 58, against 4,246 deaths in tenement houses, 1,194 in institutions, and 64 in hotels and boarding-houses that occurred in the corresponding quarter of 1879.

The number of cases reported to the sanitary bureau during the three months ending September 30, of small-pox was 6; measles, 169; scarlatina, 379; diphtheria, 631; typhoid fever, 148; and cerebro-spinal fever, 42. There was, therefore, during the quarter 1 death to every 1.50 cases of small-pox reported, 1 death to every 4.57 cases of measles, 1 death to every 5.34 cases of scarlatina, 1 death to every 2.04 cases of diphtheria, 1 death to every 1.92 cases of typhoid fever, and 1 death to every 1.05 cases of cerebro-spinal fever.

Comparative table of mortality from the principal causes of death in the third quarter of the year 1880, with the corresponding quarter of the preceding five years.

Causes of death.	1880.	1875.	1876.	1877.	1878.	1879.	Total for 5 years preceding 1880.	Average for 5 years preceding 1880.

*The first death reported from small-pox during the present quarter was that of a person who arrived from Antwerp in the steamship De Ruyter, and was sent from quarantine to Riverside Hospital. Two of the persons that died were never vaccinated, the history of one was not stated, and one whose age was 35 years was not vaccinated since infancy.

NOTES.

NEW HAVEN, CONN.—Mean temperature for October, 52°; mean humidity, 73.8; prevailing winds, northwest; rain fell on 8 days; rainfall, 4.07 inches.

PROVIDENCE, R. I.—Still-born, 11; 5 of American and 6 of foreign parentage. Only 3 deaths among the colored population in October. Of the 153 decedents 67 were of American and 86 of foreign parentage. Dr. Snow repeats his opinion as to the causation of diphtheria and enteric fever, ascribing them to impure air or polluted water, or both, and thinks that scarlet fever is at least greatly aided in its propagation by the same physical conditions.

SCRANTON, PA.—For October, 9 marriages; 7 of foreign and 11 of native birth. Births reported, 45, all white; 33 males, 12 females.

NORFOLK, VA.—The deaths for October were 33 white, annual rate 26.1 per 1,000; 36 colored, annual rate 37.5 per 1,000. Still-born, 6; 1 white, 5 colored. Mean temperature, 60°.6; maximum, 82°; minimum, 39°. Mean humidity, 68.1 Rainfall, 3.08 inches; prevailing winds, northeast.

RICHMOND, VA.—Deaths in October, 68 white, annual rate 21.4; 90 colored, annual rate 40.3 per 1,000. Still-born, 4 white; 8 colored. Mean temperature, 63°.6; rainfall, 2.14 inches.

LYNCHBURG, VA.—Deaths in October, 11 white; 18 colored; population as to color not given. Still-births, 6.

MOBILE, ALA.—Deaths in October, 32 white, annual rate 17.2; 39 colored, annual rate 38.3 per 1,000.

NASHVILLE, TENN.—Deaths in October, 35 white, annual rate 15.0; 30 colored, annual rate 23.0 per 1,000. Mean temperature, 59°.9; lowest, 47°.5; highest, 72°.5. Rain on 11 days; rainfall, 7.24 inches.

SHELBY COUNTY, TENN.—Population not given. Deaths in July, 47 white; 58 colored. For August, 37 white; 42 colored. For September, 43 white; 48 colored. For October, 41 white; 55 colored.

CHICAGO, ILL.—Deaths in October, 761 white; 5 colored. Of foreign birth, 163. Premature births, 15; still-births, 48. Mean temperature, 51°.3; highest, 78°; lowest, 28°. Prevailing winds, southwest. Rain on 10 days; rainfall, 3.09 inches.

MILWAUKEE, WIS.—In October there were 2 premature and 14 still-births. Mean temperature, 48°.4; highest daily mean, 67°; lowest, 33°.5; prevailing winds, southwest; rain on 8 days; rainfall, 0.51 inches.

SAINT PAUL, MINN.—Highest temperature in September, 90°; lowest, 36°; prevailing winds, northwest; rain on 5 days; rainfall, 1.74 inches. Mean temperature for the month, 58°.9.

KEOKUK, IOWA.—Mean temperature for October, 52°.5; highest, 79°; lowest, 18°; prevailing winds, southwest. Rain fell on 2 days; rainfall, 2.02 inches.

OAKLAND, CAL.—Of 5,426 pupils in the public schools 218, or 4 per cent., were reported sick during the month of October.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING DECEMBER 4, 1880.

The following reports, for the week ending December 4, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 3; under 5 years, 1. Allegheny, Pa., 78,000; deaths, 16; under 5 years, 8; consumption 1, diphtheria 1, scarlet fever 5, measles 1. Belfast, Me., 5,308; deaths, 2; consumption 1. Brattleboro', Vt., 6,000; deaths, 2; under 5 years, 1. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 6,400; death, 1; lung disease 1. Chillicothe, Ohio, 11,000; deaths, 4; consumption 2. Clinton, Mich., 1,205; no deaths. Corinth, Miss., 2,264; deaths, 2; under 5 years, 2. Crystal Springs, Miss., 955; death, 1; under 5 years, 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Helena, Mont., 3,630; death, 1; under 5 years, 1. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,351; death, 1; lung disease 1. Kenosha, Wis., 5,500; deaths, 3; consumption 2, diphtheria 1. Lebanon, Pa., 9,000; deaths, 4; consumption 1, lung disease 1. Louisiana, Mo., 5,200; no deaths. Madison, Ind., 9,009; deaths, 4; under 5 years, 1; croup 1, pneumonia 1, puerperal 1. Milan, Tenn., 1,800; death, 1; lung disease 1. Milledgeville, Ga., 3,000; death, 1; under 5 years, 1. Monmouth, Ill., 6,000; deaths, 2; under 5 years, 1. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; deaths, 2; under 5 years, 1; scarlet fever 2. Muskegon, Mich., 11,300; deaths, 5; under 5 years, 3; diphtheria 1, enteric fever 2, malarial fever 1. Niles, Mich., 4,100; deaths, 2; bronchitis 2. Painesville, Ohio, 5,504; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; no deaths. Pleasant Hill, Miss., 253; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; deaths, 2; lung disease 1. Ripley, Miss., 1,000; death, 1; enteric fever 1. Santa Cruz, Cal., 6,000; death, 1; accident 1. Starkville, Miss., 1,454; death, 1. Steubenville, Ohio, 13,500; deaths, 3; under 5 years, 2. Summit, Miss., 1,808; death, 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 2. Tuscaloosa, Ala., 2,000; deaths, 2; croup 1. Winchester, Va., 5,000; deaths, 3; under 5 years, 3; croup 2, lung disease 1. Winona, Minn., 10,000; no deaths. Youngstown, Ohio, 15,089; deaths, 7; under 5 years, 2; consumption 2; lung disease 1, accident 1. Total population, 282,293; deaths under 5 years, 29; total number of deaths, 81; annual rate per 1,000, 15.0.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, DECEMBER 25, 1880. [No. 26.

MONTHLY REVIEW FOR NOVEMBER, 1880.

Owing to the addition of a few cities and more regular reports from others, the population represented in the tables shows an increase of 227,799 since October, and the weekly average for November is 8,020,890. But with regard to this essential basis of statistics, it must be observed that there are still several large cities, especially in the Atlantic States, whose population is greatly over-estimated, according to the returns of the tenth census so far received. These errors, while important as to the individual cities, are reduced to a decimal quantity in the general mortality of eight millions of people, and as the tables here given refer only to this general mortality, the results are vitiated to no great extent by the errors referred to. It is, however, highly desirable that all cities should as early as possible correct their estimates of population to accord with the last census. The general death-rate has been very uniform since the subsidence of the summer diseases: in September, 20.41, in October, 20.24, and in November, 20.46 per 1,000. The ratio of mortality in the white and colored races remains nearly constant; the reports from about 30 cities, representing an average weekly population of 1,525,873 white, and 333,832 colored, give for the month of November a mean death-rate of 18.4 for the white and 30.8 for the colored people.

With the view of extending the statistics furnished by the weekly reports, a new form of postal card has been furnished by the National Board of Health, and it is hoped that all health officers and others supplied with these forms will fill them so far as may be possible.

Causes of death.—The change of season, which was already well established by the third week in November, raised the rate of acute lung diseases to 2.48 per 1,000 for the fourth week, and the mean for the month was 2.22, as compared with 1.54 for October, being an advance of 44 per cent. During the same time consumption increased only from 2.96 to 3.09, or 4.4 per cent; this difference is constantly observed on the occurrence of sudden changes of weather, and the reasons are obvious. Diarrhœal diseases have steadily declined from their enormous maximum of 13.6, July 19, and have now fallen to the rate of 0.52 per 1,000, being a reduction of nearly 60 per cent. since last month. The six other zymotic diseases exhibit the following changes: *Increased.* Diphtheria from 1.27 to 1.49, or 17 per cent.; scarlet fever from 0.41 to 0.59, or 44 per cent.; measles are more prevalent than last month, but still furnish only 20 deaths for the four weeks. *Decreased.* Enteric fever from 0.52 to 0.47, or 9 per cent.; whooping-cough from 0.16 to 0.11, or 31 per cent.; malarial fevers from 0.58 to 0.35, or 23 per cent. The total result in the six diseases shows an increase from 2.96 to 3.04, or about 4 per cent. The 94 deaths from small-pox were divided as follows: New York 4, Brooklyn 1, Camden, N. J., 4, Philadelphia 85; in addition to these, 21 are reported from San Francisco, making a total of 115. Yellow fever has continued at Key West, Fla., and three fatal cases were reported during the month, the last one occurring on the 24th.

Distribution of diseases.—Consumption remains nearly the same in the Northeast section, having changed only from 3.25 to 3.28, but in the Southeast it has advanced from 3.09 to 3.64, or 18 per cent.; and in the Northwest has fallen from 2.01 to 1.88, or 6 per cent. In the latter section, however, the most marked increase in acute lung diseases is noted, namely, from 0.94 to 1.63, or 73 per cent.; the increase in the Northeast was from 1.90 to 2.57, or 35 per cent., while in the Southeast the rate has risen from 1.06 to 1.69, or 59 per cent. Measles prevail to some extent in the two Northern sections, but do not appear as a cause of death this month in the Southeast. Diphtheria and croup have generally increased, except in the Southeast, where a decline of 18 per cent. in diphtheria and an increase of only 9 per cent. in croup are noted.

Of the 676 deaths from diphtheria in the Northeast section, 461 were in the State of New York, 211 in New York City, and 208 in Brooklyn, showing an excessive mortality in the latter city. In the New England States 121 deaths were reported, and 73 from Pennsylvania. In the Northwest section diphtheria seems more uniformly distributed among the larger cities; in the Southeast section 39 out of the 70 deaths, or 56 per cent., were in Baltimore and Washington, leaving only 31 south of the Potomac and Ohio Rivers. The same observation applies to scarlet fever, the two cities above named reporting 39 out of the 63 deaths in the Southeast section, showing that portion of the country to be generally remarkably free from these two most formidable of the contagious or infectious diseases. Malarial fevers are everywhere yielding to the change of season, and show a decline of 39 per cent. in the Northeast, 33 per cent. in the Southeast, and 61 per cent. in the Northwest, the highest death-rate being only 0.87, in the Southeast section. Whooping-cough shows some increase in the Northwest, but is declining in the other sections, and the highest rate is but 0.18 per 1,000, in the Southeast. Enteric fever shows a general decline, in the Northeast, from 0.49 to 0.43, or 12 per cent.; in the Southeast, from 0.62 to 0.50, or 20 per cent.; and in the Northwest, from 0.64 to 0.57, or 11 per cent.

It will be observed that the mortality in the Southeast section from diphtheria, croup, scarlet fever, measles, and whooping-cough is generally influenced by the reports from Wilmington, Del., Baltimore, and Washington, but especially the first two cities, to a much greater degree than the proportion of their population to that of the whole section. This fact is kept in view in noting the distribution of the diseases mentioned, but those cities are included in the Southeast section chiefly on account of their large colored population, and with a view to future investigation of the diseases of that race.

ABSTRACTS FROM CONSULAR REPORTS.

LONDONDERRY, IRELAND.—United States Consul A. Livermore reports, for the week ending November 13, 25 cases and 5 deaths from typhoid fever. For the week ending November 27, 28 cases are reported, but the number of deaths is not stated.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports, for the two weeks ending November 15, a total of 196 deaths, in a population of 154,830, exclusive of the troops; annual death-rate, 33 per 1,000; mean temperature, 70°. The only causes of death noted are 3 from typhoid fever and 1 from diphtheria.

SANTANDER, SPAIN.—The report from this province for the month of September gives a total of 457 deaths, in a population of 235,300; annual death-rate, 25.3. The births during the same period were 487; annual birth-rate, 27 per 1,000. Of the decedents, 175 were under 5 years, and 105 over 60 years of age. The principal causes of death were: Small-pox, 6; scarlet fever, 4; diphtheria and croup, 9; typhus fever, 9; dysentery, 19; puerperal fever, 5; consumption, 56; acute lung diseases, 17; brain diseases, 30; diarrhœal diseases, 76.

VALPARAISO, CHILI.—United States Consul L. H. Foote reports, for the month of September, 413 deaths, in a population of 101,088; annual death-rate, 49.7; small-pox, 5 deaths; fevers, 82; consumption, 75; other lung diseases, 82.

In october there were 384 deaths; annual death-rate, 46.2 per 1,000. Deaths from small-pox, 2; fevers, 87; consumption, 52; other lung diseases, 77. The epidemic of small-pox having disappeared, clean bills of health have been issued for some time.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BURLINGTON, VT.—Under date of December 10, Dr. Geoger M. Ockford reports that cases of diphtheria and scarlet fever still occur, the latter in a very mild form. Diarrhœa has been prevalent, and several cases of a low form of "nervous fever" have been observed. Catarrhal affections have increased, as usual at this season.

GAYLORD, KANS.—Dr. M. F. Leary, under date of December 10, writes that this town of 300 inhabitants is situated in Smith County, on the North Solomon River, and on the Central Branch Railroad, 209 miles west of the Missouri River, by rail. The spring of this year was very dry, and a few heavy rains in June were followed by another drought. In July intermittent fevers appeared, and in August typho-malarial fevers began and continued until the cold weather of December 1. In the town there were 7 cases and 3 deaths; in the county, having about 14,000 population, there were about 200 cases and over 40 deaths. The epidemic extended through all the northern part of the State, and about one-third of the cases were attended with hemorrhage from the mucous surfaces, especially from the bowels. During this time other diseases proved very intractable; it is said that typho-malarial fever has never before prevailed in this part of the country.

HAVANA, CUBA.—For the week ending November 26, there were 6 deaths from yellow fever and 18 from small-pox.

During the week ending December 10, there were only 3 deaths from yellow fever; 16 deaths from small-pox occurred in the same time.

SAINT MARY'S, GA.—Dr. F. A. Barnard, port physician, reports, for the three months ending December 3, more than usual sickness in the town, ascribed chiefly to the long-continued bad weather; only one death is noted (from typhoid fever, November 9). The English brig *Nera* arrived November 30, from Jamaica, having lost her captain, whose death was said to have been from heart disease. Two seamen were sick with fever, which proved to be malarial, yielding readily to quinine. The vessel was kept in quarantine until the recovery of these cases, and no others occurred. A few days later the French brig *Blanche* arrived from Guadaloupe with a foul bill of health, but no sickness on board; she was detained for proper cleansing and fumigation.

TAMPA, FLA.—The Surgeon-General of the United States Army forwards a letter from Assistant Surgeon J. Y. Porter, dated December 10, and reporting one fatal case of yellow fever at Key West, December 4. This is stated to be the first case reported since November 24.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

The following notes have been received by the National Board of Health from the Department of State:

December 14.—The German Government having signified a desire to send a representative to the conference, but requesting a delay of one or two months, the honorable Secretary of State replied that such delay was not admissible, in view of the number of acceptances already received for January 1, 1881.

December 16.—Mr. Yoshida, minister from Japan to the United States, informs the Department of State that his government will be duly represented at the conference, but does not give the name of the delegate.

December 17.—The Russian Government will be represented at the conference by its minister to the United States, Mr. Bartholomei.

A communication from the Department of State to the National Board of Health, dated December 21, states that the Japanese Government will be represented at the conference by its present minister to Washington, Mr. Jusbir Yoshida Kigouari. A note of the same date announces that the Roumanian Government will not be represented in the conference, but will be glad to profit by its results, applying them, so far as Roumania is concerned, in administration.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING DECEMBER 11, 1880.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

Total population, 254,077; deaths under 5 years, 32; total number of deaths, 107; annual rate per 1,000, 22.0.

TUXPAN, MEXICO.—Dr. A. M. Boyd reports, for the month of November, 25 deaths, being at an annual rate of 41.7 per 1,000. The causes noted are: Consumption, 2; pneumonia, 1; asthma, 1; malarial fevers, 11; gastritis, 1; meningitis, 2; jaundice, 1; epilepsy, 2; paralysis, 1, and accidents, 3. No epidemic or contagious disease has occurred, and the sanitary condition is excellent.

SINGAPORE.—United States Consul A. G. Studer, under dates of November 1 and November 8, reports his consular district free from contagious, infectious, or epidemic diseases.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JANUARY 1, 1881. [No. 27.

ABSTRACTS FROM CONSULAR REPORTS.

BRIDGETOWN, BARBADOES.—United States Consul W. H. Polleys reports for the month of November 58 deaths in a population of 20,000, giving an annual death-rate of 35.2 per 1,000. No contagious diseases are reported, and the sanitary condition is good. Mean temperature, 84°.

CASABLANCA, MOROCCO.—United States Consul John Cobb notifies the National Board of Health, under date of November 20, that he proposes to suspend his reports, as they cannot be based upon any reliable information. The Moorish population positively refuse to give any reports of deaths or diseases, and most of them have no medical attendance in sickness; the fatal termination of any disease is regarded simply as the will of God, and not to be averted by human means.

HONOLULU, SANDWICH ISLANDS.—United States Consul F. P. Hastings, under date of December 1, reports 37 deaths during the month of November. Of these, 6 were under 5 years and 7 over 60 years of age. The nationalities were, Hawaiian 25, Chinese 3, and the remainder from Europe and the United States, excepting two from other islands near Hawaii. Among the causes of death are noted, consumption, 3; dropsy, 5; asthma, 1; accident, 1; paralysis, 2; old age, 3. Attention may here be called to the great number of deaths ascribed to *dropsy* in the islands of the Pacific and other warm climates. Dropsy being only a symptom of other disease, it may be inferred that disorders of the viscera, and especially of the liver, are the causes of death in the cases so reported.

LAS PALMAS, CANARY ISLANDS.—United States Consul W. H. Dabney reports 50 deaths during the month of September. Among the diseases noted are, diseases of the brain, 7; diarrhœal diseases, 14; consumption, 4; convulsions (of children), 8. The population is not stated.

MALAGA, SPAIN.—United States Consul H. C. Marston, under date of November 30, explains the apparent anomaly in his reports, of more deaths from small-pox than cases recorded. He states that he has reason to believe that only a portion of the cases that recover are reported, while nearly all the fatal cases are known. The records are very imperfectly kept, but the mortality, as reported, is nearly correct. The cases of small-pox now occurring are of mild form, and excite no alarm in the city.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton, under date of December 6, reports 13 deaths from small-pox during the week ending December 4. The disease always exists in the city, and becomes generally diffused or epidemic about once in five or six years. The year 1874 was the last period of its unusual prevalence. The storm and high water of that year destroyed or damaged an immense number of the wretched dwellings of the poor, and those rendered homeless were crowded together in the central part of the city. The filth and indifference to all conditions of health in which these people lived caused a rapid spread of small-pox, which extended to other parts of the city and continued to rage for more than a year until the material was exhausted. During the months of August and September of this year the disease was not particularly fatal, but with the first "northers" of November it increased, and during the five weeks ending December 4 there were 62 deaths, being at the annual rate of 40.3 per 1,000 from this disease alone. The total number of deaths from small-pox since August 12 is 104. The deaths from all causes during the five weeks ending December 4 were 109, giving an annual death-rate of 71 per 1,000. Even this rate is no doubt too low, as probably 25 per cent. of deaths are not reported, and the estimated population of 16,000 is supposed by the consul to be too high by one thousand. Small-pox is chiefly confined to the poorer classes of natives, and to children, most adults of that class having had the disease. Their prejudice against vaccination precludes any effectual measures of prevention. Only one foreigner is known to have taken the disease this season, and the exemption of strangers and of the better class of natives is remarkable, considering the frequent exposure to contagion which they must encounter in all public places. On the American side of the river, at Brownsville, Tex., it is stated there were 4 fatal cases in October and 15 in November, in a population of 6,000. An attempt was made to remove cases to a hospital, but it was soon abandoned, and at present patients are isolated in their houses so far as possible, and a yellow flag displayed on infected premises when they are known to the authorities. A quarantine against Brownsville was recently declared by the commanding officer at Fort Brown, but not before one of the soldiers had taken small-pox. At Point Isabel, in the same county, the disease is reported to be severe and to have prevailed for some time. No cases are known to have occurred in any of the above-named places among those who were vaccinated and had observed due precautions.

SINGAPORE.—United States Consul A. G. Studer reports his district free from contagious and infectious diseases up to November 15.

SURINAM, GUIANA.—United States Consul H. Barnett makes the following report of this colony during the year 1879:

The colony of Surinam, of which the capital is Paramaribo, lies between British and French Guiana.

The area of the territory of this Dutch dependency is about 2,800 square geographical miles, of which it is estimated but 700 are known, and of these but a small portion has been cultivated or inhabited.

The original formation of the land situated along the bank of the Surinam River, on which the capital is built, shows a basis of weather-beaten granite, which may be taken to be the formation of the other parts of the colony also.

Extensive savannahs and sand reefs are met with. Rivers and creeks intersect the country, and there are vast forests rich in timber of great variety, abounding with fruit-trees, medicinal herbs of singular efficacy and shrubs and flowering plants.

The cultivated parts of the colony lie along the sea-coasts and on the banks of rivers and creeks.

The quality of the soil is remarkable for its fertility, and the alluvial depth varies in different parts, but as a general rule may be considered greatest towards the borders of the coast and river banks, diminishing more or less regularly as it extends inland.

This colony has erroneously acquired notoriety for the insalubrity in its climate.

Epidemic diseases are not prevalent here. Cholera has never visited the place. Small-pox and yellow fever have only occasionally prevailed. Although intermittent fevers are prevalent, new-comers are not subject to the disease unless they have been long exposed to the miasma or are enervated by long residence, or become otherwise predisposed to the fever, which is rarely fatal.

Dysentery is generally considered very prevalent and fatal in warm climates, but it is not particularly common or severe here. It is generally met with in broken-down subjects or among those who use improper food or indulge too freely in the unripe acid fruits of the country.

Diarrhœa occurs from change of seasons, quality of food, or the impure water used by the lower classes. Now and then it manifests itself in the form of an epidemic of a few weeks' duration, but it is found amenable to treatment, and soon disappears.

Ulcers are unfortunately too common among the immigrants, and are and have been the bane of the dirty, the lazy, and the inattentive.

Other diseases, endemic in the tropics, prevail here also, but do not cause a greater mortality than elsewhere.

The seasons of the year are: a long, rainy season, which sets in about the middle of April and lasts until August; a long, dry season, which commences about September and lasts until November; a short, wet season from December until January, and a short, dry season from February until about the middle of April.

The atmosphere at times, even in the dry season, is loaded with imperceptible moisture.

The mean annual temperature is 83° Fahrenheit, and the average annual rainfall from 80 to 90 inches.

The prevailing wind is from the northeast. During the long dry season the wind generally sets in at dawn from the south (land breeze) and blows towards the sea. It occasionally prevails during the night, and is often charged with miasma and loaded with effluvia from decomposing animal and vegetable matter.

Two things must attract attention in this colony, namely, the excess of deaths over births, and of children born out of wedlock over those born in wedlock.

Many have attempted to solve the problem with regard to such an

excess of deaths, since it cannot be attributed to the unhealthy state of the country, and it has been ascribed to several causes, such as carelessness of mothers towards their children, faith in the efficacy of indigenous herbs which cause them to refuse the aid of medical practitioners, superstitious usages, constant exposure from want of proper clothing, the use of injudicious food, &c.; and it therefore becomes worthy of note that during the year 1879 the births have exceeded the deaths, a circumstance which the oldest colonist cannot remember.

The number of illegitimate children born yearly makes manifest the prevalence of concubinage.

The majority of the natives lead a roving life, and in many instances with hardly the semblance of a habitation. The natural resources of the country being so abundant, they have no fear of hunger, and live on what they obtain by fishing and hunting.

Although the adjacent West Indian Islands and the Brazils were to a considerable extent infected with yellow fever during the past year, this colony again escaped. The quarantine measures adopted during 1879 were on vessels arriving from West Indian and South American ports.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Under date of October 27, Señor Pedro J. Salicrup gives the following description of the city of San Juan, of Porto Rico, and its sanitary condition:

San Juan, the capital of the island of Porto Rico, the most populous city and the most important center of commerce of the island, is situated on the northern coast on an islet about two and a half miles long from east to west and half a mile in its widest diameter, surrounded by the bay that forms the harbor, which is sheltered and capacious, but its bottom is muddy and full of banks for want of cleaning, and the water extends into marshes lying to the southeast of the city. The population, according to the last census, is 23,240, of which 10,957 are males and 12,283 females; 10,977 whites and 12,263 colored. The thermometer stands about 79° Fahr. during the winter and reaches 86° Fahr. in the summer. The prevailing wind is the east trade-wind during the day, and the "Terral," or land breeze, at night, from March to October. From the beginning of November to the end of February a strong north wind sets in, accompanied by frequent showers, constituting the winter or rainy season. During the last months of summer there are frequent atmospheric changes accompanied by thunder-storms and very heavy showers.

The city proper is located on the western end of the islet, on a hill sloping to the south, and surrounded by high walls, with six gates, two to the north, two to the south, one to the east, and one to the west. The streets are rather narrow, paved with round stones, and have granite sidewalks. The buildings are constructed of solid masonry, with thick walls, high ceilings, and large doors in front and rear, which constitute all their means of ventilation, as they have no interspace between them. Their architecture is very simple; they are generally one or two stories high, with large balconies in front, flat roofs, and have a small yard at the rear paved with brick or granite, which contains the cistern for collecting rain-water, as there is no other water supply. The upper floor of two-story houses is generally inhabited by one family, and the lower is divided into tenements, in each of which a whole family dwells. These tenements are generally small (about 20 or 25 feet square), and have no other means of ventilation than through the door, which is closed at night; the front rooms open on the public street and the interior ones into the hall or the yard. Many low houses, of one story, are similarly arranged, and some contain twenty rooms with about eighty inhabitants. At the back part of the yard, and not very distant from the cistern, is the latrine, which, in houses that contain many inhabitants, often requires to be emptied; this is done indifferently in the day or night, and without the use of disinfectants, polluting the air of the whole neighborhood. All the washing of clothes is done in these yards, and the refuse water from this and other sources is either launched into the latrine or kept in receptacles to be poured on the public street after eleven o'clock at night. All yards have a small drain to the street for the surplus rain-water; though this dirty water is also allowed to flow, soiling the sidewalk and giving rise to very unpleasant odors, which are perceived all along the street. The city has no public drains, with the exception of a sewer which extends a small distance from the central square in the lower part of the town, in front of the city hall, to the harbor, where it opens at a short distance from the water and just at the point where ships anchor, and where some of the commercial stores are situated. This sewer was constructed with the object of collecting and carrying off the rain-water from the upper part of the city, which flooded the lower part. Some houses, however, situated in the vicinity of the sewer are connected with and drain into it, and as there is no more clean water to flush it than the rain-water, it happens that in dry weather the refuse water is charged with organic matters, which drain from these houses and stagnate in the sewer, giving origin to the formation of noxious gases, which escape through its openings, causing an intolerable stench to be perceived all along the course of the sewer. There are four public squares, which are simply open spaces paved with granite or cement, with some benches around; there are a few trees in two of them, but they are so small yet that they give no shade to the benches. There are two public walks situated outside of the city, well paved and with large trees, where people go in the evening to enjoy the fresh breeze. There is no public hospital in the city; they are constructing a very large building, which was originally designed for that purpose, situated at some distance from the town and near a large marsh, but before it is finished, they speak of assigning it to other purposes. There is a small hospital for female paupers, which contains twelve beds, sustained by charitable donations, managed by the bishop and a board of ladies, and served by a medical officer appointed by them. The sick poor are attended at their own houses by medical officers paid for that duty by the municipal council, and in cases of severe illness or wounds, they are taken to the military hospital, where a special ward is kept for the reception of such cases; but this is only done when the patient has no home or cannot be properly cared for by his family. The number is also limited, as the ward only contains thirty beds.

On account of the present small-pox epidemic, a special hospital has been improvised, with the object of isolating cases of this dis-

case that might occur among the poor who inhabit crowded houses. It is located in old wooden barracks situated in the upper part of the city, is very well ventilated, and has done good service in preventing the spread of the disease. The military hospital, which is situated also in the upper part of the city and in a very crowded district, is an old brick building, arranged on the general wards system. It contains four wards, two for the treatment of sick soldiers, one for prisoners from the state and public prisons, and one for the sick poor. There is no special ward for contagious diseases, and all kinds of affections are treated in the same general ward. The mortality in this hospital has always been high, but especially so in the last two years, during which yellow fever and small-pox have been epidemic. The hospital is in charge of medical officers of the army, and the nursing of patients is done by Sisters of Mercy.

The public market, situated at the upper end of the city, is large, well ventilated, and clean. The public supply of meat is controlled by the municipal council, which assigns it to an individual, who is engaged to supply fresh meat to a certain hour in the day, at a fixed price, agreed on beforehand. The meat is retailed by butchers employed by the board and is of the worst quality, as most of the cattle used are old oxen, which after becoming useless for agricultural work are fattened for the purpose. Beef and pork are the meats most generally consumed. Mutton is little used. Fresh fish is always to be found. Vegetables are abundant. Many of the poor seldom use meat, which, besides being bad, is sold very dear. The slaughter-house is situated outside of the walls and to the north of the city near the sea, into which it drains; it is clean and well ventilated. In its neighborhood exist several old wooden houses inhabited by people who trade in tallow, and when this is being made a very unpleasant smell is produced, which, carried to the city by the north wind, causes great discomfort to the inhabitants of the upper part of the town.

The water used is rain-water collected and stored in cisterns which are built under ground; they are generally of great capacity, and the water contained in them pours from the house-roofs, which are very seldom swept, carrying with it the infinity of *debris* and organic matters which constitute the dust of cities, together with fragments of dead insects and other impurities, which settle in the bottom as a pultaceous sediment, leaving the supernatant water comparatively clear and pure; but every succeeding rainfall not only increases the quantity of sediment, but by its inflow stirs up that which had already accumulated, rendering the water impure until sedimentation is again accomplished. In dry weather, as there is little water in them, every time that water is drawn out this sediment is disturbed and renders it very turbid. Cisterns are cleaned when the impurity of the contained water forces itself upon the senses. This water is generally filtered for drinking purposes through sandstone filters, which render it clear and pure; but poor people drink it as it comes from the cistern. The scarcity of water in cisterns has been such in dry weather that on several occasions the local government has been compelled to bring water from rivers or other sources to supply the inhabitants, who otherwise had suffered the horrors of thirst. To the west of the slaughter-house, and at some distance from it, is the cemetery, which is very neat, but too small for the requirements of the population. It contains a chapel and a dead-house, and is encircled by a wall. Outside of this wall there is a place for the burial of persons who die of contagious diseases. The system of interment generally followed here is in niches, of which the municipal board owns a great number to hire for a term of three or five years, at the expiration of which time, if the lease is not renewed by the relatives of the deceased, the remains are removed to the charnel-house.

The prevailing diseases are all kinds of malarial affections during the summer and catarrhal affections in winter. Typhoid fever, liver, lung, and heart complaints, rheumatic, syphilitic, and skin diseases are common. Croup, measles, and whooping-cough appear occasionally as an epidemic among children, causing many deaths. Small-pox, yellow fever, and Asiatic cholera are epidemic diseases, which only appear when imported. The first-named disease is already endemic in the country, for since the epidemic which caused so many deaths in this city in 1875, and extended over the whole island, it has continued to exist with more or less intensity in different towns until it again appeared in epidemic form in this city at the beginning of 1879, and is reigning as such yet. According to official data the number of persons attacked by small-pox from October, 1879, to this date has been 549, and the number of deaths in the same period of time 185. Vaccination is compulsory and carried out once a week all through the year by the municipal medical officers, either at the city hall or from house to house, but most of the people have a great repugnance to it and often evade the law, because they think that when small-pox is epidemic vaccination sooner brings it on the person vaccinated, while others think it dangerous because they say that syphilis and other blood diseases are inoculated through it. The arm to arm vaccination is the method generally practiced, and when there are no pustules the fluid brought in tubes from England and other countries is used.

Yellow fever generally makes its appearance at intervals of eight or ten years; it is, as a rule, imported into this harbor from the neighboring island of St. Thomas, or some of the British islands where it originates, makes this city its stronghold, and extends to the whole island, excepting the towns situated in the mountainous districts, which thus far have enjoyed immunity from it, and after causing many deaths it gradually disappears until newly imported. At the beginning of May, 1879, two cases of yellow fever made their appearance on board of an English schooner arriving here from St. Thomas, which were admitted in the civil ward of the military hospital. One of them, a native of Nova Scotia, had the *black vomit*, but yet he recovered, suffering afterward from glandular enlargements. Subsequent cases of yellow fever appeared among the crews of foreign ships lying in this harbor, some from St. Thomas, where the disease was known to be epidemic at the time, and others that had been lying in the vicinity of the vessel in which the first case appeared. From this it spread to all the ships lying at anchor in the harbor and to the population on shore, beginning (as always occurs) among foreigners, and especially Spanish recruits, among whom it was very fatal, and extending afterward to the natives, continuing ever since, with more intensity in the summer and less in the winter months, until the present time, when some cases exist in the military hospital. The number of deaths from yellow fever among the civil population from October, 1879, to this date is 139. In the military hospital from the 1st of May of the present year to the 22d of October 226 cases of yellow fever have been admitted, with 106 deaths, 119 discharged, and 1 case remaining in hospital.

Asiatic cholera made its appearance for the first time in the year 1855, causing great mortality among the population of the whole island. It was imported into this island from St. Thomas through the port of Fajardo, a town on the east coast; thence it spread by contagion all over the country, decimating the population of some cities, and after visiting every town and settlement it disappeared. Since then it has not prevailed again.

The annual rate of mortality in this city is about 24.78 per 1,000, and the rate of births 25.98 per 1,000. Two boards of health exist in the city—the superior board, presided over by the governor of the island, which directs all sanitary matters of the province, and the local board, which is presided over by the mayor, and of which, among others, the medical officers of the municipal wards and the health officer of the port are members. This board controls all the sanitary arrangements of the city and its harbor. The quarantine regulations are very strict, and infected vessels or those arriving from infected ports, either with clean or foul bills of health, are quarantined for a term of from 5 to 20 days, according to circumstances. Diseases considered infectious are small-pox, Asiatic cholera, and yellow fever. All vessels coming from Cuba during the months of July and August, without regard to their bills of health, are considered suspicious, and are subject to a detention which may last from 1 to 5 days. There is a lazaretto which was built about three years ago on a barren islet situated at the entrance of the harbor to the west of the city, but this islet is surrounded by high reefs and the sea is so rough around it that only small boats, and in very good weather, can land on it, and on this account the said lazaretto had to be abandoned. When a vessel is put in quarantine it is ordered to be anchored in a certain part of the harbor separated from the rest; all communication with shore or other ships is strictly forbidden; and to enforce that provision a sanitary watch is placed at a certain distance from the vessel. Vessels bringing passengers and cargoes entering port with foul bills of health not wanting to keep the quarantine imposed upon them, as it often happens with steamers, are allowed to transfer their cargo to lighters which are isolated in the middle of the harbor during the quarantine period, and passengers are transferred to some schooner or other vessel which they have to procure at their own expense, and which is to be subject to the same rules; this involves great expense and trouble on the part of passengers, and occasions heavy losses to merchants, for the said lighters in rough weather often sink, or the merchandise is damaged by sea-water. There are many ordinances referring to sanitary matters, but they are disregarded by the inhabitants, as they are only enforced by the sanitary authorities when an epidemic exists.

Burial permits are required in this city, and since the beginning of the present year a certificate from the attending physician, stating the cause of death, is required by the municipal authorities before the permit is granted.

No comparative table of mortality from principal causes of death or any other kind of report is published by the board of health, and to obtain any information on those subjects causes much trouble and loss of time, as it has to be compiled from a record which is not intended for publication.

FORT ADAMS, R. I.—Under date of December 21, Dr. C. H. Crane, U. S. Army, reports an epidemic of measles among the troops, 32 cases having occurred since the middle of November. Six cases are still under treatment, but are convalescent.

HAVANA, CUBA.—For the week ending December 17, five deaths from yellow fever are reported, of which two were in the military hospitals. There were 10 deaths from small-pox during the week. The Spanish bark *Adela* which sailed for Brunswick, Ga., on the 15th, had been about a month at a wharf always foul, and often infected with yellow fever. The first mate of this vessel had a mild attack of yellow fever, and the patient remaining on board prevented fumigation of the vessel before her departure.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING DECEMBER 18, 1880.

Total population, 329,370; total deaths, 127; deaths under 5 years, 36; annual death-rate per 1,000, 20.1.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

The Department of State, under date of December 24, informs the National Board of Health that the King of the Netherlands has appointed his minister to the United States, Mr. de Pestel, and also Dr. T. J. van Leent, of the Netherlands navy, to represent that government in the conference.

RIGA, RUSSIA.—United States Consular Agent P. Bornholdt, under date of December 8, reports that no statistics of births and deaths can be obtained. The general condition of the city is reported to be good, and the only contagious disease noted is small-pox, of which a few cases have occurred. The temperature has suddenly fallen from an average of 45° to 9° F., and an improvement in the health of the city is expected to follow the change.

SANTIAGO DE CUBA.—United States Consul J. C. Landreau reports for the month of November 191 deaths, in a population of 40,000, giving an annual death-rate of 58.1 per 1,000. Among the diseases noted are 72 cases and 53 deaths from yellow fever, 8 fatal cases of small-pox, and 16 cases with 6 deaths from typhoid fever. The cases of yellow fever were confined to the Spanish troops, and the port and shipping being free from contagious diseases, clean bills of health are issued.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JANUARY 8, 1881. [No. 28.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

The following advices have been received from the State Department by the National Board of Health:

December 28: A note from the British minister at this capital states that the Government of the Dominion of Canada has appointed Dr. J. C. Taché, deputy minister of agriculture in that colony, to represent it in the Conference.

December 28: According to a telegram from the minister of the United States at Stockholm, Count Carl Lewenhaupt, envoy extraordinary and minister plenipotentiary at Washington, will be appointed to represent Sweden and Norway at the Conference.

December 30: The ministers of China to the United States reply to the invitation to have a delegate present at the Sanitary Conference that, owing to the absence of telegraphic communication between Shanghai and Peking, there will not be time for a delegate to be appointed and to arrive before the termination of the Conference.

The diplomatic representative of Chili, now in this capital, Don F. S. Asta Buruaga, although not officially delegated, will attend at the Conference, and act according to subsequent instructions from his government.

A delegate, stated, through unofficial advices, to be Dr. Silva Amado, left Portugal on December 17; and the Portuguese minister at Washington, the Viscount das Nogueiras, has also been requested to attend.

In view of the official receptions which take place on January 1, the President has directed that the first official session of the Conference will be held in the Department of State on Wednesday, January 5, 1881, at noon.

The Department of State has communicated to the National Board of Health the following additional information concerning the representation of foreign governments at the Conference which is to assemble on the 5th instant:

The Turkish minister, Grégoire Aristarchi Bey, has been appointed to represent his government.

The Kingdom of Belgium appoints Mr. George Neyt, who is councilor of legation and at present chargé d'affaires here. Mr. Edward Léve, Belgian consul-general at Philadelphia, will also attend.

The Danish diplomatic representative, Mr. De Bille, is directed to attend, but has no authority to sign any convention until the same shall have been submitted for the approval of his government.

The delegate from Austria-Hungary, Count Bethlen, having been detained for a time, the councilor of the legation, Count Lippe, will act in his place.

The diplomatic agents of Bolivia, Hawaii, Hayti, and Peru have signified their intention to attend, under the recent decision of the Department of State that all such officers shall be admitted to the Conference without waiting for special orders from their respective governments.

SANITARY LEGISLATION IN KANSAS.

Dr. M. F. Leary, of Gaylord, Kans., offers the following draft of an act of legislature for obtaining and recording vital statistics:

GAYLORD, KANS., Dec. 20, 1880.—I have the honor to submit herewith for your approval a draft of a bill to be presented to the legislature at the coming session, establishing a registry of births and deaths in this State; and, while it is not presumed to be perfectly adapted to all communities, it is believed that it will serve to establish a thorough record and inspection, and prove a basis for additional regulations by local authorities.

The expense of the registry, after the purchase of the books, will be merely nominal.

It is needless to remind you of the value of such registry, not only to the medical profession for statistical purposes, but, in its varied legal aspects, to the State itself, and for the prevention and detection of crime.

Should this bill, or a kindred one, meet your approbation, it is hoped that you will lend your assistance in making it a law.

Very respectfully,

M. F. LEARY, M. D.

Be it enacted by the legislature of the State of Kansas:

1. That each city and township clerk in this State shall keep in his office two books, one of which shall be known as the Register of Births, and the other as the Register of Deaths, which books shall have suitable columns for the entry of all facts required; and said books will be a part of the city or township "records," and will contain a record of every child-birth and every death occurring in said city or township.

2. Every physician, surgeon, or midwife, attending professionally a child-birth, or, in the absence of such, the father or the mother of the child shall within ten (10) days after the birth of a child, furnish to the clerk of the city or township in which said birth has occurred, a statement in writing of the fact; which statement will contain the names of the father and the mother, their place of residence, the date of the birth and the locality thereof, and the sex and color of the child. The clerk, upon the receipt of such statement, will at once enter in the Register of Births, in the appropriate column, the information so given, with the name of the person furnishing it.

3. Within forty-eight (48) hours after the occurrence of the death of any person in this State, and before the removal of the remains for interment, the undertaker or other person having the interment in charge, shall obtain a "permit for interment" from the clerk of the city or township in which said death has occurred.

4. In applying for such "permit of interment," he shall present to the said clerk a "certificate of death" in writing, which said certificate shall contain the following facts in relation to the deceased, to wit: Name, age, sex, color, nativity if known, occupation when alive, married or single, date and locality of death, and disease or cause of death. Said "certificate of death" will be attested by the physician or surgeon attending deceased in last illness, or, in absence of such attendance, by any practicing physician having cognizance of the cause of death, or by the health officer, physician, or coroner of the city, township, or county in which the death occurred. Where persons are found dead and the cause of death is unknown, and persons die by unlawful means, the certificate of death will be attested by the coroner or a justice of the peace. But nothing in this act shall be construed as altering or interfering with the duties and powers of coroners as defined under the law.

5. The clerk of the city or township, having received such "certificate of death," will at once enter in the Register of Deaths, in the appropriate columns, the facts contained therein, with the name of the person attesting to the same, and the cemetery or locality where the remains will be interred. He will indorse on the "certificate of death" the fact of its entry, and a "permit for interment" in the cemetery or locality specified.

6. The "permit for interment" shall be filed in an appropriate book, with the records of the cemetery in which the body is interred; and no cemetery association in this State will inter any body until such "permit for interment" is presented. Persons dying without the State, whose bodies are brought within the State, will require a permit for interment.

7. For each child-birth recorded in the Register of Births and for each death recorded in the Register of Deaths, the city or township clerk making the same shall be entitled to receive the sum of ten (10) cents, to be paid out of the city or township funds.

8. The common council of each city and the township board of each township will cause to be procured the necessary books and blanks requisite for the purposes of this act, and the clerk of each city and township will keep on hand, for distribution as needed, printed certificates of births and deaths.

9. Whoever shall violate any provision of this act, or fail to comply therewith, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not less than five (5) nor more than twenty (20) dollars.

This act shall take effect and be in force from and after the 1st day of May, 1881.

YELLOW FEVER AT VERA CRUZ, MEXICO.

The journal entitled "*El Siglo Diez y Nueve*," published in the city of Vera Cruz, gives in its issue of December 1, the following statistics of mortality from yellow fever in that place for 14 years:

Month.	1867.	1868.	1869.	1870.	1871.	1872.	1873.
January	0	7	0	0	3	2	1

ABSTRACTS FROM CONSULAR REPORTS.

MALTA AND GOZO.—The report for the two weeks ending November 30 gives a total of 165 deaths, in a population of 154,830; there were 3 deaths from diphtheria, and 1 from typhoid fever. Annual death-rate, 27.2 per 1,000. Mean temperature, 67°.

MATAMOROS, MEXICO.—The report of United States Consul W. P. Sutton, for the week ending December 18, shows that small-pox is the prevailing disease. Of a total of 22 deaths, 17 were from small-pox, and 350 cases were believed to exist in the town of 16,000 inhabitants. The annual death-rate was over 71 per 1,000.

MOSCOW, RUSSIA.—United States Consul A. Weber, having received the official report of mortality for the year 1879, gives the following extracts from the same:

The population is estimated at 601,922, but is probably nearer to 700,000. There were 22,823 deaths during the year, so that the death-rate was between 32.6 and 37.7 per 1,000. Of the decedents 12,570 were males, and 10,253 females; under 5 years of age, 10,955. Among the latter were 256 deaths from inherited syphilis, leaving 22 deaths from that disease among adults and children over 5 years. The rate of mortality was excessive in one particular district, and especially in a large foundling hospital, established by Catherine II, in which 4,215 deaths occurred during the year. The general mortality for 1879 was less by 2,995 than that for 1878, and no epidemic of contagious disease is reported for the past year, the deaths from that class of affections not being above the average.

The report for the month of September gives 1,424 deaths, of which 71 were from typhoid fever and 124 from other contagious or infectious diseases. There were 355 deaths from diseases of the lungs, and 212 from diarrhœal diseases.

SINGAPORE.—United States Consul A. G. Studer reports 316 deaths during the month of October. Of these, the following causes are noted: Consumption, 24; other lung diseases, 13; fever, 78; diarrhœal diseases, 38; old age, 11.

ST. THOMAS, WEST INDIES.—Under date of December 7, United States Consul Victor Thompson states that some yellow fever and small-pox have been reported there. A letter of December 22 reports that yellow fever has become epidemic, and though not so rapid in its progress as in the United States and other places, is fully as fatal in St. Thomas as elsewhere. The disease may be considered endemic in the island, and the mode of treatment (not stated) is quite different from that adopted in other places.

VERA CRUZ, MEXICO.—The report of United States Consul S. T. Trowbridge for the month of December shows that during the two weeks ending on the 19th of that month there were 51 deaths from yellow fever and 2 from small-pox, out of a total of 111. The mortality for the month was 195, of which 92 deaths were from yellow fever; malarial fevers, 22; consumption, 17; other lung diseases, 7.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

ATTICA, WYOMING COUNTY, N. Y.—Dr. Julius A. Post, secretary of the county medical society, reports, under date of December 27, that during the fall and early winter typhoid fever and diphtheria have prevailed in that region to an unprecedented extent. The latter disease has been very malignant and fatal. Both diseases prevail in Wyoming and Genesee Counties, chiefly along the water-courses, and in such parts of the country as are so level as to prevent proper drainage. Attica has no local board of health.

BAD LANDS CANTONMENT, DAK. TER.—Under date of December 19, Dr. C. C. Miller, U. S. Army, reports from this post a case of small-pox in that neighborhood. The patient was removed to the care of her friends, and two weeks later the man who drove the vehicle had varioloid, having had small-pox previously; he recovered in one week. Strict quarantine was established at the post, and all the command vaccinated; no case has occurred among the troops.

ERIE, PA., DEC. 24.—Dr. E. W. Germer, health-officer, sends to the National Board of Health a specimen of "home-fed pork" being used by a family living about eight miles from Erie. In this family, the wife of a farmer named Charles Veit, and two children aged respectively two and three years, were taken sick about the same time. At the time, the cases were diagnosed as typhoid fever, and the disease was ascribed to pollution of the well-water from a privy situated only 25 feet from the well. Dr. Germer having examined the food of the family, finds the pork full of *trichina*, and ascribes the illness of those affected to that cause.

Dr. James H. Wroth, of Camden, N. J., under date of November 3, gives the following account of the late epidemic of small-pox in that place:

My information, gleaned from physicians, dispensary reports, and records of deaths, is as follows:

In February, 1880, a colored man, who had been engaged in whitewashing a house in Philadelphia where small-pox had existed, was taken with the disease. The case was reported, and, as far as professional authority could be exercised, quarantine established. Contrary to the physicians' orders, visits were made by friends and the disease broke out in a family (also colored) a few blocks distant, the children being attacked. One, if not two, died, having contracted the disease by the visit of their mother to the first patient, the mother herself escaping. From these foci the disease spread, being favored by the location. Its stronghold was the district between the two railroads, Walnut street and Kaighn's avenue, as shown by the map. In the southwest corner of this division are crowded together families, chiefly colored, many in one house, with no drainage or other sanitary provisions. On a visit made there I found the inhabitants of Sycamore street, between Seventh and Ann (see map), are compelled to go one-half block for water, or use that from two pumps that stand in the street suspiciously near the gutter. In addition, no provision seems to be made for garbage, as I am able to testify, having narrowly escaped a deluge of kitchen garbage that a servant was getting rid of in the manner peculiar to the locality, *i. e.*, by dumping it in the street. The cesspools are of the old-fashioned kind, and upon inquiry seemed to be rarely cleaned. In this district are families sleeping, eating, and cooking in one room, and in this district the disease obtained its most decided foothold.

Under these unfavorable conditions the dispensary physician succeeded in keeping the disease controlled to a certain extent. During his term (which expired by resignation July 10) he repeatedly urged upon the sanitary committee the necessity of a hospital, but as they considered fumigation with sulphurous acid sufficient, nothing definite was done until July, when a hospital was erected on vacant lots between the seventh and eighth wards. The near proximity of a private residence led to the granting of an injunction, which was argued July 26 and not sustained. This hospital has been in daily use to this time.

At the time of erection the medical profession protested against its situation, it being near the spot formerly utilized by the cesspool cleaners to dump the contents of their carts, and having to the northwest a small creek, or rather ditch, which receives the contents of the Tenth street sewer and drains the marsh, at the head of which stands the hospital. The hospital itself stands upon sandy ground, little higher than the marsh, and is supplied with water from a well upon the premises. In protesting against the site, the profession suggested the use of a bluff on Cooper's Creek, on the outskirts of the city and at an elevation of between 40 to 50 feet above low-water

mark. There the land is gravelly, steep enough to furnish good drainage, and is fully as isolated as the present location. To this the committee objected on account of cost, it being necessary to lease the land, whereas the present hospital being built upon or near the intersection of unopened streets, the charge would be little or none. A memorial to the council, sent through the sanitary committee, to erect in a suitable locality a permanent hospital has, thus far, been tabled.

In the latter part of June a proposition was made by a manager of the dispensary to the sanitary committee, stating that, as the disease was confined to a certain locality, volunteer physicians would, if the city provided virus, proceed to the spot and, with the aid of the police, vaccinate every person (man, woman, and child) within the district. Physicians were ready, but the committee took no notice of the offer until August 18, when they stated that the physicians should "go ahead." As the disease was then a general instead of a local one, and the offer having been made forty days previously, the physicians very properly declined to proceed as volunteers.

In the mean while several conferences were requested by the city medical society, but at none was any member of the sanitary committee present save the chairman. Vaccination and quarantine were requested by the society, and, although the ordinance creating the said committee gave it discretionary power regarding quarantine, they have, so far, declined to inforce it, and also declared that they had no power to dispose of the clothing, &c., of a patient unless declared a nuisance, and then only at the expense of the patient. Seeing that there was nothing to be obtained from the local authorities, Dr. E. M. Hunt, of the State board, was requested to meet the society and the sanitary committee were invited to be present. This request brought a full attendance. Dr. Hunt's views, the same as originally stated by the city society, were vaccination and quarantine.

In addition, the request was made that the committee should organize under State law, so as to obtain greater powers. The last, I regret to state, has not been done. Free vaccination was ordered and carried out, about 8,000 persons, as estimated, being already protected, and thus having to pay for what had been a gratuitous offer. This vaccination probably has had an effect in reducing the death-rate. I am unable to say what effect it had upon the number of cases. The rapid extension of the disease seems to be due to the lack of protection, especially among the young, although cases are reported with good vaccine scars, and others who have contracted the disease for the second time. Although at present it seems to be on the decrease, the approach of cold weather with its attendant crowding of families is watched with attention by the profession.

I would also state that, in October, I noticed the non-report of a death in hospital. This led me to inquire into the matter, and I found 29 unreported deaths occurring during August and September. No information could be obtained from the authorities, and I determined to obtain definite reports, so I at once informed the State board of the discrepancy, with the result of bringing in the certificates. Since then I have learned of 5 deaths from small-pox yet unreported. My reasons for not reporting this to the National Board of Health have been a vain hope of inducing the committee to act in concert with me and the nearness of the end of the quarter. The committee bury those who die at the hospital, no burial permit being taken out from the clerk's office. Full facts are probably in possession of the inspector, but are, at present, not available. Since my appointment as dispensary physician all reports have been sent to me, and they have furnished me the only means for detecting the above cases, and I would add that there *may* be others still unreported.

In addition to the above report, the following extract from the sanitary inspector's record is given:

Total number of cases, 435; white, 313; colored, 122; under 5 years, white, 43; colored, 30. In 41 cases, as recorded in hospital, no record was kept of previous vaccination or of the diagnosis. These cases are omitted in the following statement: Diagnosed as varioloid, 91 cases; as variola, 103 cases. The number of patients who had been vaccinated was 148; of these, 70 cases were diagnosed as variola, and 78 as varioloid. Of those who had not been vaccinated, 153 were reported as cases of variola, and 13 as varioloid. At the close of the report, November 22, the disease had not entirely disappeared, and there was some apprehension of a new outbreak when the people were more crowded together on account of the colder weather.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

Ripley, Miss., 1,000; deaths, 2; under 5 years, 1; consumption 1, whooping-cough 1. Rock Island, Ill., 12,000; death, 1. Santa Cruz, Cal., 5,000; death, 1; pneumonia 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 4; under 5 years, 2. Summit, Miss., 1,808; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 2; enteric fever 2. Tuscaloosa, Ala., 2,000; death, 1. Winchester, Va., 5,000; deaths, 3; consumption 1, croup 1. Youngstown, Ohio, 15,089; deaths, 3; under 5 years, 2; croup 1. Total population, 309,808; deaths under 5 years, 22; total number of deaths, 85; annual death-rate per 1,000, 14.7.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JANUARY 15, 1881. [No. 29.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-Office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it,* since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

ABSTRACTS FROM CONSULAR REPORTS.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports for the month of October 78 deaths in a population of 20,000; annual death rate, 45.8 per 1,000; mean temperature, 84°. The causes of death are not given.

DUBLIN, IRELAND.—For the week ending December 18 the average annual death-rate was 28.6 in sixteen principal town districts of Ireland. The lowest was 6.4 in Dundalk; the highest 40.1, in Cork. The mean death-rate from the zymotic diseases was 5.6 per 1,000, being greatest in Cork. No epidemic disease is reported from any of the districts, but those which are most fatal to children seem to be generally prevalent.

GHENT, BELGIUM.—United States Consul A. Lefebvre reports 6 deaths from typhoid fever and 8 from other contagious diseases during the month of November. The total number of deaths was 264, of which 40 were from consumption, 38 from acute lung diseases, and 44 from diarrhœa. Annual death rate, 24.6.

GUAYMAS, MEXICO.—For the month of November only 6 deaths are reported: two adults died from fever; one child from convulsions and another from unknown cause; one man by suicide, and one from disease not stated. The sanitary condition of the town is good. Mean temperature for the month, 77°.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webster reports 44 deaths during the month of September: population, 27,500; annual death-rate, 19.2 per 1,000. In October there were 48 deaths, with an annual rate of 20.6 per 1,000. No epidemic disease prevailed.

LONDON, ENGLAND.—In the report given by authority of the registrar-general of births and deaths in 23 large cities of the United Kingdom, for the week ending December 18, 5,591 deaths are noted, and 3,261 births. The average annual mortality was 20 per 1,000. In London the rate was 19.6; in Edinburgh, 19; and in Dublin, 26. In twenty of the larger English towns the lowest rate was 13, in Wolverhampton; the highest 26, in Nottingham. In these twenty towns the annual death-rate from the seven principal zymotic diseases averaged 2.6 per 1,000. Small-pox caused 33 deaths in London and 1 in Manchester, but none in the eighteen other cities.

MALAGA, SPAIN.—With the report for the week ending December 19, United States Consul H. C. Marston forwards a copy of a proclamation dated November 30. In this the mayor informs the people that provision has been made for gratuitous vaccination, and urges them to avail themselves of the protection so offered.

MATAMOROS, MEXICO.—During the week ending December 25 there were 13 deaths from small-pox reported, and the number of cases in the town was estimated at 350. The population is 16,000.

MELBOURNE, AUSTRALIA.—For the month of September 439 deaths are reported; population, 265,000, including suburbs. Annual death rate, 20.1 per 1,000. The only causes of death noted are 2 from cholera and 2 from typhoid fever. Consumption is said to be one of the prevailing diseases; and measles are reported, but no deaths from that disease.

NASSAU, NEW PROVIDENCE, WEST INDIES.—Reports for the month of December state that this city is remarkably free from sickness, and is in excellent sanitary condition.

NAVASOTA, TEX.—Under date of January 2, Dr. A. R. Kilpatrick reports that for the two months preceding there had been a great improvement in the health of that place. In November there were still many cases of malarial fever, but no deaths, excepting one infant, a white female, which died of marasmus. The lowest temperature was 20°, the highest was 82°: frost was observed on 5 days, and ice formed on 4 days. Rain fell on 16 days.

In December four deaths occurred: two colored persons, one from consumption, and one from disease of the brain; one white female died in child-birth, and a German, aged 63, from general debility. The lowest temperature was 10°, Fahr., on the 29th, noted as the lowest ever known in December. The highest temperature was 66°. Very little rain fell during the month.

NEW ZEALAND.—The report from the four principal boroughs for the month of October gives a total of 77 deaths. Of these 15 were from consumption; enteric fever, 4; diarrhœa, 2; heart disease, 3; acute lung diseases, 13; puerperal, 2; old age, 1; and 5 by violence or accident. The population of the four boroughs being 75,719, the annual death rate was 12.2 per 1,000. The death-rate for the whole population of 15 boroughs was 20.7 per 1,000.

PARA, BRAZIL.—United States Consul A. C. Prindle reports for the month of October 123 deaths, chiefly from malarial fevers. The population being 40,000, the death rate was 36.4.

PARIS, FRANCE.—The report for the week ending December 23 gives 481 marriages, 1,144 births, and 979 deaths. The population is stated at 1,988,806, which makes the annual death-rate 25.6 per 1,000, while the birth-rate was nearly 30. There were 293 deaths under 5 years, and 95 still-births.

SAMARA, RUSSIA.—The United States consul at Moscow sends the following report of Dr. Bulewsky concerning an epidemic of diphtheria at Samara, a city on the Volga River, about 900 miles from Moscow. Children attacked under one year of age, not fed from the mother, died almost without exception, while sucklings generally recovered. Of those between 1 and 5 years 86 per cent. died. From 5 to 10 years the mortality was 80 per cent. of the cases. The cases among males and females under 5 years were about equal, but between 5 and 20 years more than twice as many females as males were attacked, owing to the confinement of the former in infected houses, and their duties as nurses, while the males were at work in the fields.

SANTANDER, SPAIN.—In this province, having a population of 235,300, the deaths reported for October were 505, giving an annual rate of 25.3 per 1,000. Deaths under 5 years, 213; over 60 years, 132; from diphtheria and croup, 30; whooping-cough, 9; typhus fever, 32; dysentery, 25; puerperal fever, 10; consumption, 41; other lung diseases, 34; diseases of the brain, 12; diarrhœal diseases, 37. The births during the month were 522; annual rate, 26.1 per 1,000.

In November there were 435 deaths; annual rate, 22.5 per 1,000; under 5 years, 138; over 60 years, 129; from measles, 24 scarlet fever, 1; diphtheria and croup, 21; enteric fever, 10; typhus fever, 14; dysentery, 13; diarrhœa, 22; puerperal fever, 7; malarial fevers, 7; consumption, 49; other lung diseases, 48; diseases of the brain, 25. The births were 467; annual rate, 23.7 per 1,000.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JANUARY 1, 1881.

CITIES IN WHICH BURIAL PERMITS ARE REQUIRED.

States and cities.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Consumption.	Croup.	Diarrhœal diseases.	Diphtheria.	FEVER. Enteric.	FEVER. Malarial.	FEVER. Scarlet.	FEVER. Yellow.	Lung diseases, acute.	Measles.	Puerperal diseases.	Small-pox.	Whooping cough.	All zymotic diseases.	Accidents.

Iuka, Miss., 816; death, 1. Jefferson, Tex., 3,351; deaths, 2; consumption 1, pneumonia 1. Kenosha, Wis., 5,500; deaths, 4; consumption 2, congestion of lungs 1. La Salle, Ill., 8,885; deaths, 7; under 5 years, 4; lung diseases 3, measles 2, consumption 1, accident 1. Louisiana, Mo., 5,200; deaths, 2; under 5 years, 1; pneumonia 1, measles 1. Madison, Ind., 9,009; deaths, 5; under 5 years, 2; consumption 2, scarlet fever 2. Martinsburg, W. Va., 6,534; no deaths. Milledgeville, Ga., 3,000; death, 1; under 5 years, 1; pneumonia 1. Monmouth, Ill., 6,000; deaths, 3; under 5 years, 3; croup 1, scarlet fever 1. Morton, Miss., 210; no deaths. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,300; deaths, 4; under 5 years, 1; scarlet fever 3. Nebraska City, Nebr., 5,200; deaths, 2; diphtheria 1, pneumonia 1. Niles, Mich., 4,200; death, 1; bronchitis 1. Okolona, Miss., 2,000; deaths, 1; typhoid fever 1. Painesville, Ohio, 5,504; no deaths. Pass Christian, Miss., 4,000; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; no deaths. Port Gibson, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Santa Cruz, Cal., 5,000; no deaths. Springfield, Ohio, 23,000; deaths, 8; cerebro spinal meningitis 1, diphtheria 2, pneumonia 2, whooping-cough 1. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 2. Summit, Miss., 1,808; no deaths. Titusville, Pa., 9,000; deaths, 4, consumption 1, typhoid fever 1. Tampa, Fla., 740; no deaths. Tuscaloosa, Ala., 2,000; deaths, 3. Watertown, Wis., 10,000; deaths, 10; under 5 years, 4; accident 1, consumption 1, croup 1, diphtheria 2, pneumonia 1, measles 2, old age 1. Winchester, Va., 5,000; deaths, 3; under 5 years, 2; bronchitis 2, old age 1. Winona, Minn., 10,000; death, 1; under 5 years, 1. Youngstown, Ohio, 15,689; deaths, 3; bronchitis 1, puerperal 1. Total population, 349,779; deaths under 5 years, 30; total number of deaths, 110; annual rate per 1,000, 16.4.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Gaylord, Kans.—Under date of January 1, Dr. M. F. Leary reports that diphtheria of very fatal type prevails. During the recent cold weather the temperature fell to 17° below zero; a snow-fall of about two inches is also reported.

Havana, Cuba.—During the week ending December 30 there were 4 deaths from yellow fever and 9 from small-pox.

New Brighton, Richmond County, N. Y.—Dr. A. L. Carroll, under date of January 1, states that a board of health has been established in the village, which is a suburb of New York. A convenient form of report is furnished to physicians for noting all cases of contagious or infectious disease.

DELEGATES TO THE INTERNATIONAL SANITARY CONFERENCE.

Under date of January 5, the honorable Secretary of State informs the National Board of Health that Mr. William Coppinger, the Liberian consul-general at Washington, has been designated by his government as a delegate to the conference.

Sydney, Australia.—During the month of October there were 557 deaths and 736 births in the city and suburbs. The rate of infant mortality was very high, being about 64 per cent. of all deaths in the city, and 69 in the suburbs. Measles and whooping-cough contributed largely to this mortality.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JANUARY 22, 1881. [No. 30.

MONTHLY REVIEW FOR DECEMBER, 1880.

Reports from several large cities having come in too late to appear in the tables of mortality for December, the average population represented for the five weeks ending January 1, 1881, is 393,782 less than that for the month of November. The occasional omission of reports sent in too late for the weekly tables will be corrected in some degree by the annual report of mortality for the year 1880, which will include all cities from which full reports for the year have been received, and in which burial permits are required.

In the tables for this month, the effect of missing reports from large cities is evident in the apparent changes of death-rates, as will be indicated below, in comparing them with those of the preceding month. These omissions in the tables affect the death-rate of the zymotic diseases to a great extent, and as these form the principal part of those selected for the tables, the changes of their death-rates are not to be taken as absolutely correct indications of their relative prevalence in one month as compared with another.

In December the general annual death-rate was 21.81, against 20.46 in November. This increase is to be ascribed in part to the sudden and extreme fall of temperature which occurred in the latter part of the month.

TABLE OF PRINCIPAL CAUSES OF DEATH.

Week ending—	Population.	Total deaths.	Annual rate per 1,000.	Deaths under 5 years.	Annual rate per 1,000.	Per cent. of deaths.	Consumption and lung diseases.			Consumption.			Lung diseases, acute.			Diphtheria and croup.			Diphtheria.

Causes of death.—The remarkable "cold wave" referred to above, and which affected the whole country, has raised the rate of mortality from acute lung diseases from 2.22 to 3.20 per 1,000, or 44 per cent. At the same time consumption shows only an advance of 7 per cent. These two classes of disease must account for the increase in the general death-rate, as the aggregate of the six principal zymotic diseases shows no appreciable change, being 3.08 this month against 3.04 in November. Of these diseases the following show an increased mortality: Scarlet fever, from 0.59 to 0.77, or 31 per cent.; measles are still increasing, but as yet give only a total of 61 deaths; from whooping-cough 93 deaths are reported, but this number is only 26 more than that for November. The following diseases have decreased: Diphtheria, from 1.49 to 1.43, or 4 per cent.; enteric fever, from 0.47 to 0.42, or 11 per cent.; and malarial fevers, from 0.35 to 0.25, or 30 per cent. Croup has shared in the decline of diphtheria, the rate having fallen from 0.87 to 0.82, or 5 per cent. Malarial fevers and diarrhœal diseases show the same rate of decline since last month, each having a death-rate 30 per cent. less than in November. Smallpox is evidently becoming more prevalent, 227 deaths being reported for this month against 115 for the last. The deaths reported for December are distributed as follows: New York City, 18; Camden, N. J., 9; Philadelphia, 189; Chicago, 7; San Francisco, 4. The reasons for omitting this disease in the list of death-rates have been given in previous reviews.

Distribution of diseases.—In presenting the results of the reports from the three sections into which it has been found convenient to divide the United States, with reference to diseases and mortality, each section will be considered in the order of the tables.

Northeast section.—In this portion of the country the death-rate from consumption and other lung diseases has advanced from 5.85 to 7.04 per 1,000, or 20 per cent. Scarlet fever shows the greatest change, having advanced from 0.63 to 0.89, or 41 per cent. This disease prevails at present chiefly in New York and Pennsylvania; diphtheria still prevails in Brooklyn, in Boston, and in Pittsburgh, Pa., to an extent out of proportion to their population. The increase of measles is also notable in this section, and is observed in the same places where diphtheria prevails. The death-rates of other diseases have remained nearly stationary in this section.

Southeast section.—Here the increased mortality from acute lung diseases is from 1.69 to 2.86 per 1,000. This is explained by the almost unprecedented fall of temperature above mentioned; the deaths from consumption continued at the same time to preserve nearly their former rate. A general increase of diphtheria, scarlet fever, and enteric fever is observed in this section, but it is noted that two of these diseases prevail only as far south as Maryland, the city of Baltimore alone reporting 47 per cent. of the deaths from scarlet fever, and 60 per cent. of those from enteric fever in the southeast section, while the population of the city is but 24 per cent. of that for the whole section. Measles continue to be absent from the list of causes of death in the southeast, and whooping-cough has the low rate of 0.21, which is, however, an increase of 11 per cent. since last month. Malarial fevers still remain highest in this section; but their rate of mortality has fallen from 0.87 to 0.49 under the influence of the cold weather.

Northwest section.—The absence of reports from important cities is chiefly to be observed in this section, and the result is shown in some of the diseases most prevalent in those cities. The decrease of consumption from 1.88 to 1.05, and of acute lung diseases from 1.63 to 1.32 per 1,000, is the fact most worthy of note in this section. Diphtheria also has declined from a rate of 1.37 to 0.54, and croup in similar proportion. Enteric fever, scarlet fever, measles, and whooping-cough show a great reduction of mortality; but this is partly due to the want of reports from places in which those diseases chiefly prevail.

CLIMATE OF PENINSULAR FLORIDA.

[By CHARLES J. KENWORTHY M. D., Jacksonville, Fla., president of the Florida Medical Association and of the Duval County Medical Society.]

The climatic treatment of pulmonary diseases is a subject of great importance. Professor Reuhle remarks: "In view of the fearful dissemination of consumption throughout all zones, and the enormous percentage of mortality, the importance of checking the spread of this terrible disease, and of diminishing the number of its victims, has never seemed so urgent as at the present time, when there is a growing demand for more attention to the preservation of health, and when the conviction is gaining ground that this is the main feature of medical science. The occurrence of yellow fever in a Southern city, with the consequent loss of a few scores or hundreds of human lives, creates a world-wide sensation, but the great and continuous mortality from phthisis attracts but little attention. In the language of Dr. Jones, of Saint Paul, Minn., "The registrar-general of Great Britain gives about twelve out of every hundred deaths to consumption as a mean rate through a series of years. Of the people inhabiting the globe, 3,000,000 each year die of this disease." Owing to the great annual mortality from phthisis, more especially in certain portions of the United States, and as remedial measures exert but little influence, climate deserves the intelligent investigation and attention of the profession.

Florida is a popular climatic resort for pulmonary invalids, and as ignorance prevails regarding its climatic effects upon diseases and mortality, reliable data should be published. Several writers have asserted that the climate of this State is "moist and sedative," and a recent essayist in a leading medical journal stated that "the atmosphere of Florida is loaded with moisture." If these statements are reliable, a large proportion of pulmonary invalids should shun this State as a climatic resort, and seek some locality where the air is "dry and bracing."

Mentone, on the Mediterranean, possesses an American as well as a European reputation as a sanitarium, and it is recommended because of its temperature, equable climate, and low relative humidity. It is conceded that Minnesota is remarkable for the dryness of its climate. Hence, for the purposes of comparison, we shall give data applicable to these localities as well as to Florida.

Mean relative humidity.

Years.	Minnesota.			Florida.		
	Breckenridge.	Duluth.	Saint Paul.	Jacksonville.	Punta Rassa.	Key West.
	Pr. ct.	Pr. ct.	Pr. ct.	Pr. ct.	Pr. ct.	Pr. ct.
1875	75.7	67.2	69.0	70.3	76.9	71.5
1876	67.7	68.2	69.1	67.2	73.9	76.4
1877	72.2	71.9	67.6	69.3	70.5	74.1
1878	76.2	71.5	67.7	68.7	72.4	74.5
1879	74.1	72.8	65.3	69.7	72.3	74.2
Mean for 5 years for stations	73.2	70.3	67.7	69.0	73.0	74.2
Mean for 5 years for States	70.4			72.1		

From the above data it will be seen that the atmosphere of Peninsular Florida contains but 1.7 per cent. of moisture in excess of that of Minnesota for the entire year. But it is the five cold months which interests invalids, and during this period Peninsular Florida possesses a drier climate than Mentone or Minnesota.

Mean relative humidity.

	November.	December.	January.	February.	March.	Mean for 5 months.	Mean for 5 months for States.
Mentone, Mediterranean*	71.8	74.2	72.0	70.7	73.3	72.4	.....
Breckenridge, Minn	76.9	83.2	76.8	81.8	79.5	79.6	74.3
Duluth, Minn	74.0	72.1	72.7	73.3	71.0	72.6	
Saint Paul, Minn	70.3	73.5	75.2	70.7	67.1	71.3	
Jacksonville, Fla	71.9	69.3	70.2	68.5	63.9	68.8	72.7
Key West, Fla	77.1	78.7	78.9	77.2	72.2	76.8	
Punta Rassa, Fla	72.7	73.2	74.2	73.7	69.9	72.7	

* "The Riviera," by C. J. Sparks, M. D., London, 1879, page 9.

From the above data it will be seen that the mean relative humidity of Mentone exceeds that of Jacksonville by 3.6 per cent. Three stations in Minnesota have a percentage of 1.6 over three stations in East Florida; and Saint Paul shows a percentage of 2.5 above Jacksonville.

To further illustrate the subject of humidity, I will append a table giving the mean relative humidity of Jacksonville for the five cold months for five years.

Mean relative humidity, Jacksonville, Fla.

Years.	November.	December.	January.	February.	March.	Mean for five months.	Normal mean.
	P. ct.	P. ct.	P. ct.	P. ct	P. ct.	P. ct.	P. ct
1875–76	78.9	71.1	67.8	70.4	64.2	69.7	70.3
1876–77	68.2	64.5	73.6	69.0	63.5	67.8	67.2
1877–78	71.8	70.0	67.8	68.5	66.4	68.9	69.3
1878–79	70.0	66.3	65.0	65.0	66.0	66.5	68.7
1879–80	70.5	74.6	77.1	69.0	63.7	71.1	69.7
	71.9	69.3	70.3	68.4	63.9	68.8	69.0

In connection with the climatology of Jacksonville, there is one point worthy of notice, and that is the remarkably low percentage of humidity during the much dreaded month of March, the mean for five years being but 63.9, as against 73.3 at Mentone; 79.5 at Breckenridge; 67.1 at Saint Paul; 76.8 at Atlantic City, N. J.; and 68.4 at Nassau, N. P.

As an equable temperature is deemed of great importance in the treatment of pulmonary diseases, we will give the ranges for the five cold months at a few points recommended as winter resorts for invalids.

Comparative temperature for the colder months.

	Years.	November.	December.	January.	February.	March.	Mean for 5 months.
Atlantic City, N. J	4	45	48	48	48	46	47
Minnesota, 3 stations	4	70	63	57	58	58	61
Florida, 3 stations	4	35	37	35	33	35	35
Colorado, 2 stations	4 & 2	68	70	72	58	66	67
Los Angeles, Cal	1	41	44	35	30	35	37

To illustrate the thermal ranges for one year, we shall quote from the work of Dr. Denison, of Colorado, and add the ranges for Peninsular Florida.

	Mean monthly range.	Range of monthly means.	Annual means.	Annual range.
Atlantic City, N. J	41	44.1	49.7	89.5
Denver, Colo	60.5	53.7	49.2	131
Colorado Springs	63.5	47.7	46.8	123
Florida Peninsula	29.7	19.2	73.4	50

Sunshine and an opportunity to take exercise out of doors are all-important elements in the treatment of chronic disease; and as evidence that this State is favored with sunshine and fair weather, and not "cloudy, foggy, and rainy weather," as has been asserted, I will append tables in illustration, given by Dr. Jones, in the New York Medical Journal for September, 1879.

Mean rainfall and number of rainy days at a few sanitaria.

Locality.	Number of years.	November.	December.	January.	February.	March.	Five months.
Nice	28	5.11	4.12	3.06	1.68	2.89	16.86
Mentone	9	5.34	3.15	1.70	2.18	4.13	16.50
Atlantic City, N. J	5	7.61	4.86	4.39	4.27	3.59	24.72
Jacksonville, Fla	5	3.02	3.38	2.34	5.14	2.84	16.62
Key West, Fla	5	2.43	1.33	2.18	2.22	0.94	9.10
Punta Rassa	5	2.38	0.99	1.69	2.67	1.04	8.77

Rainy days (including snow).

Locality.	Years.	November.	December.	January.	February.	March.	Five months.
Jacksonville	5	8.6	7.4	7	8.6	5.8	37.4
Mentone	8	10.1	7.25	5.1	5.66	9.55	37.48
Saint Paul, Minn	1	4	13	8	6	11	42

Meteorological data from signal office, U. S. A., Jacksonville, Fla.

RAINY DAYS.

Date.	November.	December.	January.	February.	March.	Remarks.
1874–1875	14	6	15	10	5	"Rainy days," all days on which rain fell.
1875–1876	10	4	4	8	7	
1876–1877	5	10	6	6	6	
1877–1878	9	9	5	10	8	
1878–1879	5	8	5	9	3	
Average	8.6	7.4	7	8.6	5.8	37.4 days in 5 months.

Meteorological data from signal office, Jacksonville, Fla.—Continued.

CLOUDY DAYS.

Date.	November.	December.	January.	February.	March.	Remarks.
1874–1875	4	6	12	3	8	
1875–1876	8	4	5	7	2	
1876–1877	6	3	2	10	7	
1877–1878	10	11	11	9	10	
1878–1879	9	11	5	11	4	
Average	7.4	7	7	8	6.2	35.6 cloudy days in 5 mos.

When a day is marked "rainy," but a few drops may have fallen. A measurable or non-measurable quantity may have fallen in a few minutes, and the remainder of the day be bright and clear. In Florida the rains are frequently "torrential," in short, severe, brisk, followed by bright and clear weather.

Temperature is an important factor in the successful treatment of disease, and to illustrate this subject we shall give the temperature for the cold months at a few places recommended as sanitaria:

Mean temperature at several sanitaria.

If we consider climatic factors we shall find that Florida presents many attractions and advantages as a climatic resort for invalids. The temperature is favorable; the mean relative humidity is adapted to the treatment of all forms of pulmonary disease; the air is salubrious, and in a large portion of the State airy and bracing; atmospheric changes are infrequent, and sunshine and fine weather the rule. The State possesses insular, inland, dry, and moist localities, semi-tropical and cooler sections, and if the nature of any given case should necessitate a change a suitable climate can be reached in a few hours and at a trifling expense.

A recent writer in a medical journal asserted that the mortality from consumption in this State is very great. With the exception of the city of Jacksonville, registration of deaths is not compulsory, and no data existed upon which such a statement could be based. To ascertain the mortality of this city I addressed our health officer, Dr. Knight, and received the following reply:

HEALTH DEPARTMENT, *City of Jacksonville.*

DR. C. J. KENWORTHY:

DEAR SIR: A careful examination of the mortuary reports in the city sexton's office reveals the following facts:

Previous to 1878 the records were imperfectly kept and are not reliable.

Mortality for 1878	119
Mortality for 1879	171
Mortality for two years	290
Deduct from this number visitors who died of phthisis, Bright's disease, and organic disease of the heart	40
Total mortality of residents	250

Percentage of mortality per 1,000 among residents for two years, 12.5; percentage of deaths from phthisis among residents, 0.55; percentage of deaths per 1,000 from pulmonary diseases other than consumption, 1.4.

Respectfully yours,

A. W. KNIGHT, M. D.,
Health Officer.

From the published semi-annual mortuary report of this city, we find that the death-rate per 1,000 for the first six months of the present year was 10.6. Deduct from total deaths 37 non-residents who came to the State in the last stages of phthisis and cardiac disease, and the actual mortality among residents was 6.9; mortality from consumption among residents, *none*.

To determine the mortality of this State, more especially from that dreaded disease, consumption, I had a compilation of the census re-

turns made by a reliable and competent person with the following results:

Mortality per 1,000 from all causes, 9.2; deaths per 1,000 from consumption, including invalid visitors who came to the State in the last and incurable stage of this disease, 0.60; deaths per 1,000 from consumption, excluding visitors, 0.44; deaths per 1,000 from pulmonary diseases other than consumption, 0.50; deaths per 1,000 among residents from all pulmonary diseases, 0.94. There was one death from consumption, including visitors, to 15.2 from all causes. There was one death from consumption, among residents, to 18.2 from all causes.

When we take into consideration the habits, food, clothing, exposure, and habitations of a large portion of the residents of this State, coupled with the difficulty of securing medical attendance in outlying districts, and the neglect on the part of many colored people in calling in physicians, it is surprising that the mortality is so low. If pulmonary consumption is so infrequent, it is evident that the climatic factors of this State are favorable to the prevention, alleviation, and cure of that disease.

PROPOSED LEGISLATION ON ADULTERATION OF FOOD.

Mr. H. C. Meyer, of the New York Board of Trade, makes the following report to the National Board of Health:

NEW YORK, *January* 8, 1881.

As chairman of the committee appointed by the National Board of Trade to look after the passage of the inclosed bill, I am requested to send you a copy of the same, together with the memorial to Congress, and to solicit your co-operation in our efforts to secure the passage of a law designed to prevent injurious adulteration without imposing needless restrictions on commerce. I shall be pleased to receive a marked copy of any issue of your paper that contains a reference to the proposed bill.

Very respectfully,

HENRY C. MEYER.

MEMORIAL OF THE NATIONAL BOARD OF TRADE, ACCOMPANYING A BILL FOR THE PREVENTION OF THE ADULTERATION OF FOOD OR DRUGS.

To the honorable the Senate and House of Representatives of the United States in Congress assembled:

Your memorialists respectfully represent that at the annual meeting of the National Board of Trade, held at Washington, December 12, 1879, the following resolution was adopted:

"Whereas the public mind has of late been considerably agitated by the alleged general adulteration of food; and

"Whereas the question of pure and wholesome food and drink is one of great importance to the people of the United States; and

"Whereas local attempts to regulate the sale of food have, on account of limited jurisdiction or other causes, generally proved inadequate for the purposes for which they were designed, and it is therefore important that wise laws (if possible, national in character) should be enacted, which will afford adequate protection both to consumers and honest manufacturers; and

"Whereas a member of this board offers to place $1,000 at the disposal of the executive council of this board for a prize or prizes to be given for the best act or acts, accompanied by an essay designed to prevent injurious adulteration and regulate the sale of food without imposing unnecessary burdens upon commerce: Therefore, be it

"*Resolved*, That the president of the National Board of Trade be authorized to appoint a committee of experts, to be composed of five members, one of whom shall be a member of the medical profession, one a chemist, one a member of the legal profession, and one a merchant; said committee to examine and pass upon the merits of any acts or essays which may be submitted to them and to award prizes therefor. The committee as soon as possible after their appointment to make public the necessary conditions, and when their labors are completed to place in the hands of the president of this board an act designed to accomplish the purpose above described."

The competition instituted by virtue of this resolution ended October 1, 1880. The committee of experts awarded the first prize ($500) to G. W. Wigner, F. C. S., of London, an analytical chemist of high reputation; the second prize ($300) to Vernon M. Davis, of New York; and the third prize ($200) to William H. Newell, M. D., of Jersey City. They also, in accordance with the above resolution, prepared the draft of a national act designed to prevent future deleterious adulterations, which is hereto annexed. The committee who made the award, and who have prepared the accompanying bill, consisted of John S. Billings, M. D., surgeon, U. S. A., vice-president of the National Board of Health; Prof. Charles F. Chandler, president of the New York board of health; the Hon. B. Williamson, ex-chancellor of New Jersey; and A. H. Hardy, esq., of Boston. In the composition of this committee are included the sanitarian, the health-officer, the chemist, the jurist, and the merchant. In the treatment of the subject the advantages of their varied experience and special knowledge have been obvious.

At the annual meeting of the National Board of Trade, held at Washington, December 15, 1880, the following resolutions were unanimously adopted:

"Whereas the National Board of Trade, at its last session, instituted a competition to secure the best essay upon the subject of adulteration of food and drink in the United States, together with drafts of suitable State and national laws designed to prevent injurious adulteration and regulate the sale of food without imposing unnecessary burdens upon commerce; and

"Whereas a committee of experts were appointed to select the best essay and to prepare drafts of acts that, in their judgment, would best secure the objects for which the competition was instituted; and

"Whereas the committee has submitted a report with the drafts of acts referred to: Therefore, be it

"*Resolved*, That the report of the committee of award upon the subject of adulteration of food and drugs, together with the drafts of national and State acts submitted by said committee, are approved by this body.

"*Resolved*, That the president and secretary of this board be directed to transmit to the United States Senate and House of Representatives copies of the report of the committee and of the draft of a national act, requesting in behalf of this body the passage of the same.

"*Resolved*, That the president of this board appoint a committee of three, as the representatives of this body, to promote the proposed national legislation to prevent the adulteration of food and drugs.

"*Resolved*, That the secretary be instructed to transmit copies of the reports and of both drafts of acts to each of the constituent boards, with the request that they will use their influence to secure their enactment.

"*Resolved*, That the thanks of the National Board of Trade are due, and are hereby tendered, to Dr. John S. Billings, surgeon U. S. A., and vice-president of the National Board of Health; Prof. Charles F. Chandler, president of the New York Board of Health; ex-Chancellor B. Williams, of New Jersey, and A. H. Hardy, esq., of Boston, for the valuable services rendered by these gentlemen to this board and to the commercial community."

In accordance with the above resolutions your memorialists pray that the said bill be speedily enacted into law.

FREDERICK FRALEY, *President.*
HAMILTON A. HILL, *Secretary.*

BOSTON, *December* 31, 1880.

A bill to prevent the adulteration of food or drugs.

Be it enacted, &c., That no person or corporation shall knowingly transport, or cause to be transported, from the State, District, or Territory in which he resides or does business, into any other State or territory, or from any foreign country, or other State or Territory, into the State or Territory in which he resides or does business, for sale or barter, or to be offered for sale or barter, any article of food or drugs adulterated within the meaning of this act, and any person violating the above provision shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not more than fifty dollars for each offense.

SEC. 2. That no person shall, within the District of Columbia or in any of the Territories, or in any fort, arsenal, dock-yard, or reservation, or other place under the jurisdiction of the United States, manufacture, offer for sale, or sell any article of food or drugs which is adulterated within the meaning of this act, and any person violating this provision shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding fifty dollars.

SEC. 3. If, on examination of any article of food or drugs imported from any foreign country, it is found to be adulterated within the meaning of this act, a return to that effect shall be made upon the invoice, and articles so noted shall not be permitted to pass the custom-house or be delivered to the consignees, unless on re-examination, as provided for in this act, it shall be found that the said articles are not adulterated.

SEC. 4. The owner or consignee shall have the privilege of calling at his own expense for a re-examination, and on depositing with the collector of customs such sum as he may deem sufficient to defray such expense, it shall be the duty of the collector of customs to procure a certificate, under oath from a public analyst, of a careful analysis of the articles in question; and in case the report by certificate of the analyst shall declare the report of the officer who examined the goods to be erroneous, and the said articles to be unadulterated, the said articles shall be returned to the owner or consignee, and passed without reservation on payment of the duties, if any. But in case the officer's return shall be sustained by the analyst, the said articles shall remain in charge of the collector of customs, to be disposed of in accordance with regulations to be prepared by the National Board of Health and approved by the Secretary of the Treasury: *Provided*, That the owner or consignee, on payment of charges of storage and other expenses necessarily incurred by the United States, and on giving bond, with sureties satisfactory to the

collector, agreeing to remove said articles from the United States, shall have the privilege of re-exporting them at any time within the period of six months after the date of the report of the inspector or public analyst.

SEC. 5. In order to carry into effect the provisions of this act, the Secretary of the Treasury is hereby authorized to appoint from names submitted to him for that purpose by the National Board of Health, one or more suitably qualified persons as special inspectors and as public analysts for adulterated food and drugs at such ports of entry as the Secretary of the Treasury may deem expedient, and it shall be the duty of the National Board of Health to prepare instructions governing the work of such inspectors and analysts, which, when approved by the Secretary of the Treasury, shall govern their action, and that of collectors of customs, in preventing importation from foreign countries of food or drugs adulterated within the meaning of this act.

SEC 6. The National Board of Health shall make, or cause to be made, examination of specimens of food and drugs collected under its direction in various parts of the country, and shall publish in its weekly bulletin the results of such analyses. If it shall appear from such examination that any of the provisions of this act have been violated, the secretary of the board shall at once report the facts to the proper United States district attorney, with a copy of the results of the analyses duly authenticated by the analyst under oath.

SEC. 7. It shall be the duty of every district attorney to whom the Secretary of the National Board of Health or any collector of customs shall report any violation of this act, to cause proper proceedings to be commenced and prosecuted without delay for the fines and penalties in such case provided, unless, upon inquiry and examination, he shall decide that such proceedings cannot probably be sustained, in which case he shall report the facts to the National Board of Health. And for the expenses incurred and services rendered in all such cases, the district attorney shall receive and be paid from the Treasury such sum as the Secretary of the Treasury shall deem just and reasonable, upon the certificate of the judge before whom such cases are tried or disposed.

SEC. 8. An article shall be deemed to be adulterated within the meaning of this act—

a.—In the case of drugs.

1. If, when sold under or by a name recognized in the United States Pharmacopœia, it differs from the standard of strength, quality, or purity laid down therein.

2. If, when sold under or by a name not recognized in the United States Pharmacopœia, but which is found in some other pharmacopœia or other standard work on materia medica, it differs materially from the standard of strength, quality, or purity laid down in such work.

3. If its strength or purity fall below the professed standard under which it is sold.

b.—In the case of food or drink.

1. If any substance or substances has or have been mixed with it so as to reduce or lower or injuriously affect its quality or strength.

2. If any inferior or cheaper substance or substances have been substituted wholly or in part for the article.

3. If any valuable constituent of the article has been wholly or in part abstracted.

4. If it be an imitation of or be sold under the name of another article.

5. If it consist wholly or in part of a diseased or decomposed, or putrid or rotten, animal or vegetable substance, whether manufactured or not, or in case of milk, if it is the produce of a diseased animal.

6. If it be colored or coated, or polished or powdered, whereby damage is concealed, or it is made to appear better than it really is, or of greater value.

7. If it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of a person consuming it: *Provided*, That the National Board of Health may, with the approval of the Secretary of the Treasury, from time to time declare certain articles or preparations to be exempt from the provisions of this act: *And provided further*, That the provisions of this act shall not apply to mixtures or compounds *recognized* as ordinary articles of food, provided that the same are not injurious to health and that the articles are distinctly labeled as a mixture, stating the components of the mixture.

SEC. 9. It shall be the duty of the National Board of Health to prepare and publish from time to time lists of the articles, mixtures, or compounds declared to be exempt from the provisions of this act in accordance with the preceding section. The National Board of Health shall also from time to time fix the limits of variability permissible in any article or compound.

SEC. 10. The term "food" as used in this act shall include every article used for food or drink by man.

The term "drug" as used in this act shall include all medicines for internal or external use.

SEC. 11. All the regulations and declarations of the National Board of Health, made under this act from time to time and promulgated, shall be printed in the Statutes at Large.

SEC. 12. This act shall take effect ninety days after it shall have become a law.

REPORT OF COMMITTEE OF AWARD.

NEW YORK, *October* 27, 1880.

SIR: The committee appointed by the National Board of Trade for the purpose of awarding prizes for the best act or acts, accompanied by an essay, designed to prevent injurious adulteration and to regulate the sale of food without imposing unnecessary burdens upon commerce, have the honor to report as follows:

In accordance with the resolutions under which the committee was constituted, we have carefully examined the papers submitted in this competition, and from these have selected as the three most meritorious essays, with the accompanying acts, numbering them consecutively in the order of merit as follows (first prize, $500; second prize, $300; third prize, $200):

No. 1. The essay and acts having the motto, "*Æquo Animo.*"

No. 2. The essay and acts having the motto, "*Sic utere tuo ut alienum non lædas.*"

No. 3. The essay and acts having the motto, "*Overcome Evil with Good.*"

Upon opening the sealed envelopes, having corresponding mottoes, it is found that the authors of these essays are as follows, viz:

No. 1. Motto "*Æquo Animo,*" G. W. Wigner, F. C. S., London.

No. 2. Motto "*Sic utere tuo ut alienum non lædas,*" Vernon M. Davis, College of City of New York.

No. 3. Motto "*Overcome Evil with Good,*" William H. Newell, M. D., Jersey City Heights, N. J.

In addition to these essays we recommend the printing of the essay having the motto "*Cardinal Cajetan,*" whose author is O. W. Wight, M. D., health officer, Milwaukee, Wis.; and the remarks submitted under the motto "*Work and Wait,*" by Albert B. Prescott, Ann Arbor, Mich.

In connection with this award the following remarks are respectfully submitted:

1. In view of the statements which for the last two or three years have from time to time been made with regard to the prevalence in this country of adulterations of food which are dangerous to health and life, and which have created so much agitation in the public mind as to induce the National Board of Trade to establish this competition, it is very gratifying to find that none of the essayists produce any definite or satisfactory evidence as to the widespread existence of such dangerous adulterations in this country.

The absence of such evidence, in addition to the results recently obtained by several expert chemists in extensive series of analyses of the usual articles of food in this country, which results have been made known to the committee, fully warrants us in declaring that none of our staple articles of food or drink are so commonly adulterated as to be dangerous to health or life. Such dangerous adulterations appear to be mainly in the form of poisonous colors or coloring matters, as, for instance, in confectionery, and even these are rare.

2. The question of the adulteration of food, with perhaps the exception of milk, should therefore be considered not so much from a sanitary standpoint as from that of commercial interests; as being of the nature of a fraud in aiding the sale of articles which are not what they are represented to be. The main objects of legislation upon this subject should be to prevent deception, to furnish to the public authoritative information, and to nullify the operations of ignorant and sensational alarmists, who damage the business interests of the country quite as much as do the evils of which they complain.

3. We are of the opinion that there is much more danger to health and life in this country from adulterated drugs than there is from adulterated food, and that any legislation which is to deal with the one should also deal with the other.

4. To indicate the legislation upon the adulteration of food and drugs, which will protect health and prevent fraud, and at the same time not impose unnecessary burdens upon trade, is a matter of very great difficulty, as the result of this competition clearly shows, for we do not consider any of the acts proposed to be satisfactory. In this matter it is much better at first to do too little than too much, and the first steps in such legislation should be tentative and educational in character.

5. While it is highly desirable that the general principles of legislation on this subject should be the same in all States, we do not think it possible to secure by State laws absolute uniformity in the details in all parts of this country, and it would therefore be unwise to make the attempt.

6. We do not think that any law upon the adulteration of food and drugs can be made efficient without a properly-constituted health authority to supervise its execution. The questions involved are in a high degree technical, and require special training in those charged with administering the law. At the same time we think that the existence of such health authorities should be taken for granted in the acts, and that these should not attempt to create them.

We believe that every State should have a board of health, but that such boards should be created by independent legislation.

7. We think it unadvisable that the law should attempt to define in detail as to what an adulteration is. A very considerable amount of discretion should be left to the Board of Health in this respect, limiting it only in the direction of possible over-rigidity.

Many well-recognized articles of commerce, although harmless and even useful, may be said to be adulterated, and it should be left to the discretion of the board to exempt any article from the penalties imposed in the act.

8. Care should be taken not to make the penalties excessive. It should be remembered that mere exposure of fraudulent practices, if effectually and persistently made, is in itself a penalty, and as a rule public opinion may be trusted to make such practices unprofitable if measures be taken to make this opinion a correct one, which we think should be the great object of the law proposed.

Under no circumstances should fees or moieties to informers be allowed.

9. We think that both State and national laws upon this subject are desirable. The State law should deal with the subject in the individual State. The national law should deal with adulterated articles coming from foreign countries, or passing from one State into another, and also with adulterations in the Territories, the District of Columbia, and in all places under the special jurisdiction of the United States. It is, of course, in the highest degree desirable that the State and United States legislation on this subject should not be discordant.

The educational feature should be even more prominent in the national than in the State law, while the punitive feature should, if anything, be less severe. As the State laws will vary somewhat in this last respect, it follows that the penalties in the United States law should be at a minimum.

10. The committee will endeavor to prepare and to place in the hands of the president of the National Board of Trade as soon as possible drafts of acts, prepared in accordance with the general principles contained in this report.

All of which is respectfully submitted.

JOHN S. BILLINGS,
B. WILLIAMSON,
C. F. CHANDLER,
A. H. HARDY,
Committee of Award.

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

National Legislation—Continued.

[By Stephen Smith, A. M., M. D., of New York.]

In a preceding article the fact was stated that a motion was made in the First Congress, which sat in New York, looking to the establishment of health offices in the several ports of the Union, but that the exact purport of the motion was not known. The following were the proceedings, as given in the Journal of Congress:

"*Thursday, December* 16, 1790.

"A petition of the merchants and other inhabitants of Baltimore was presented to the House and read, praying that a health office may be established, or other provision made by law, for protecting them from infectious and epidemical diseases brought by passengers and others arriving from foreign countries.

"*Friday, December* 17, 1790.

"*Ordered*, That the petition of the merchants and other inhabitants of the town of Baltimore, which was presented yesterday, be referred to Mr. Seney, Mr. Vining, and Mr. Parker; that they do examine the matter thereof and report the same, with their opinion thereupon, to the House.

"*Tuesday, December* 21, 1790.

"Mr. Seney, from the committee to whom was referred the memorial of sundry inhabitants of the town of Baltimore, praying the establishment of a health office, made a report, which was twice read and agreed to by the House, as followeth:

"Your committee have had under their consideration the subject-matter of the said memorial, and are firmly persuaded that the same highly merits the attention of Congress. But being convinced that the regulation prayed by the memorialists is not only essential for the port aforesaid, but for all others into which considerable imports are made, are of opinion that a law ought to be passed with general provisions in this respect.

"*Ordered*, That a bill or bills be brought in pursuant to the said report, and that Mr. Lawrence, of New York, Mr. Seney, of Maryland, Fitzsimmons, of Virginia, Vining, of Delaware, and Goodhue, of Massachusetts, be such committee."

There is no evidence that this committee reported, but the inference is that the petitioners contemplated the establishment of quarantines under national regulations and supervision, and that the project received the sanction of the first committee appointed to consider the petition.

The action of Congress in regard to the port of Baltimore is as follows:

AN ACT declaring the consent of Congress to an act of the State of Maryland, was passed December 28, 1793, and approved June 9, 1794.

Be it enacted, &c., That the consent of Congress be, and is hereby, granted and declared to the operation of an act of the general assembly of Maryland, passed the 28th of December, one thousand seven hundred and ninety-three, entitled "An act to appoint a health officer for the port of Baltimore, in Baltimore County," so far as to enable the State to collect a duty of one cent per ton on all vessels coming into the district of Baltimore from a foreign voyage, for the purpose of the said act intended.

SEC. 2. *And be it further enacted*, That this act shall continue in force to the end of the next session of Congress, and no longer.

This act was repeated.

Yellow fever prevailed in the principal commercial centers during the years 1802, 1803, 1804, and 1805, but not with the fatality that it exhibited in 1798. During this period the discussion in regard to the importation and contagiousness of the fever was very exciting, and was participated in by the leading physicians of the time. Dr. Benjamin Rush, of Philadelphia, led the advocates of the local origin and non contagiousness of the fever, and Dr. David Hosack, of New York, headed the opposition. The former class had the larger number of followers and exerted the greatest popular influence. The opinion became very general that yellow fever depended upon local filth, and that it was not propagated by any infectious or contagious properties. In the light of these opinions, quarantine rules and regulations were not only useless, but were unjustifiable restraints upon commerce and travel. Dr. Rush said of quarantines: "They originated in error; millions of money have been wasted by them; thousands of lives have been sacrificed by them." Potter, an equally zealous opponent of quarantines, asserted that he "anticipated the era when our government would make it a national concern; when a consular convention at least with the nations commercially connected with us, will put a period to a system which is a reflection upon our philosophical character."

Dr. Hosack, on the contrary, not only strongly advocated quarantines, but took high ground in favor of placing them under the management of the general government.

The opinions of Rush found a supporter in Mr. Jefferson, as appears from the following card written in 1807 and his annual message of 1805. The card is dated at Monticello, September 8, 1807, and was written to Mr. Crawford. It is as follows: "Thomas Jefferson presents his compliments to Mr. Crawford, and his thanks for his Observations on Quarantines, which he has read with great pleasure. Not himself a friend to quarantines, nor having confidence in their efficacy, even if they are necessary, he sees with pleasure every effort to lessen their credit. But the theory which derives all infection and ascribes to unseen animals the effects hitherto believed to be produced by it, is, as yet, too new and unreceived to justify the public servants in resting thereon the public health, until time and further investigation shall have sanctioned it by a more general confidence."

In his annual message dated December 2, 1805, President Jefferson says:

"In taking a view of the state of our country, we, in the first place, notice the late affliction of two of our cities under the fatal fever which, in latter times, has occasionally visited our shores. Providence, in his goodness, gave it an early termination on this occasion, and lessened the number of its victims which have usually fallen before it. In the course of the several visitations of this disease, it has appeared that it is strictly local, incident to cities and on the tide-waters only, incommunicable in the country either by persons under the disease or by goods carried from diseased places; that its access is with the autumn and it disappears with the early frosts. These restrictions within narrow limits of time and space give security even to our maritime cities during three-fourths of the year, and to the country always. Although from these facts it appears unnecessary, yet, to satisfy the fears of foreign nations, and cautions on their part, not to be complained of in a danger whose limits are unknown to them, I have strictly enjoined on the officers at the head of the customs to certify with exact truth for every vessel sailing for a foreign port the state of health respecting this fever which prevails at the place from which she sails. Under every motive from character and duty to certify the truth, I have no doubt they have faithfully executed this injunction. Much real injury has, however, been sustained from a propensity to identify with this endemic, and to call by the same name fevers of very different kind, and which have been known at all times and in all countries, and never have been placed among those deemed contagious. As we advance in our knowledge of this disease, as facts develop the sources from which individuals receive it, the State authorities charged with the care of the public health, and Congress with that of the general commerce, will become able to regulate with effect their respective functions in those departments. The burdens of quarantine are felt at home as well as abroad; their efficacy merits examination. Although the health laws of the States should be found to need no present revisal by Congress, yet, commerce claims that their attention be ever awake to them."

In 1805 the city of Alexandria again petitioned Congress to provide an adequate quarantine for the District, as follows:

To the honorable the Senate and House of Representatives of the United States in Congress assembled, the memorial and petition of the common council of Alexandria respectfully shows:

That ever since the town of Alexandria became subject to the

exclusive jurisdiction of Congress they have incurred very heavy expenses in supporting a quarantine establishment, and that application has been made to the proper department of the general government for aid that has been extended by Congress to other seaport towns, and, they have received for answer that the provisions of the act of Congress could not be extended to the town of Alexandria, without legislative sanction, that act referring only to State laws, and not to the ordinances of a corporation; and also that, even waiving that question, the appropriations made to carry that act into effect had been exhausted; that the quarantine ground at Jones's Point (now the property of the United States) is well calculated for an establishment extending its protection to the city of Washington and Georgetown; that the finances of this town are altogether incompetent to carry into effect such regulations, concerning quarantine, as the importance of the measure, the safety of the inhabitants, and the due accommodation of the persons and property subjected to quarantine urgently require; that it is essential to all these objects that the provisions of the third section of the act passed on the 25th of February, 1799, entitled "An act respecting quarantine and health laws," should be extended, so as to give the same aid to the execution of the health laws of this District, as is by the same section provided for the health laws of the States; that, in addition to the warehouses and wharves, which are directed by that law to be built for the reception of goods and merchandise, humanity requires that there should be some necessary buildings for the accommodation of sick and disabled seamen and others, for the time they may be subjected to quarantine.

We finally pray, on behalf of our constituents, that Congress will pass a law for a general quarantine establishment, to be maintained at the expense of the United States; as one establishment at Jones's Point, below Alexandria, suffices for the whole District, and the expense attending the maintenance of it on a respectable footing is a grievous burden to the good people of this town.

Signed on behalf and by order of the common council of Alexandria this 27th day of December, 1805.

This communication was submitted to the Secretary of the Treasury by the chairman of the Committee on Commerce and Manufactures. The Secretary was the Hon. Albert Gallatin, who replied as follows:

TREASURY DEPARTMENT,
February 15, 1806.

SIR: The memorial from Alexandria seems to contemplate three objects: 1st, the erection of stores for a quarantine establishment; 2d, the support of the establishment itself, including the compensation of the health officer; 3d, the erection of a building for sick seamen.

As it relates to the last object, the collector of Alexandria is already authorized to expend the whole amount received from seamen in the District of Columbia. The erection and support of a regular hospital would be much more expensive than the funds will allow; and as there are as yet but three such establishments, at Boston, Norfolk, and Charleston (the last of which is authorized, but not erected), the application, considering the relative importance of other ports not yet provided for, seems rather premature.

On the second point I will only observe that the compensation of the health officer, and other expenses necessary to carry health laws into effect, are in every instance defrayed by the proper State or city, those which relate to the storage of goods only excepted; and in relation to these, the price paid for storage defrays all the current expenses; so that the erection of stores and wharves is the only expense which has ever been incurred by the United States. Whether the peculiar situation of the District of Columbia renders an exception proper seems to be a matter altogether of legislative discretion.

On the first point, viz, the propriety of erecting the necessary stores, I can only observe that the only places where that expense has heretofore been incurred are New York, Philadelphia, Baltimore, and Charleston; and if the committee shall think it expedient to comply with the application from Alexandria in that respect, I beg leave respectfully to suggest the propriety of embracing, by an appropriation sufficient for that purpose, such other ports of greater importance and similar situation as have not yet been provided for.

I have the honor to be, very respectfully, sir, your obedient servant,

ALBERT GALLATIN.

HON. JACOB CROWNINSHIELD,
Chairman of the Committee on Commerce and Manufactures.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BURLINGTON, VT.—Dr. George M. Ockford, under date of January 10, states that diarrhœal diseases had prevailed during the month of December, but had lately abated. A fatal case of malignant pustule had occurred, of which the cause was not known. The person attacked was a young man of good habits and previous good health. In his business he used a great deal of a French copying ink, and Dr. Ockford thinks there may be a possible connection between the use of this ink and the disease.

JACKSONVILLE, FLA.—Health Officer A. W. Knight, under date of January 15, observes that the population of Jacksonville, as reported in the last census, having been taken in summer, is not a proper basis for reports of mortality. At least 2,000 persons are added during the colder months, and in future reports allowance will be made for this increase.

Dr. Stephen Smith, member of the National Board of Health, forwards the following extracts from a letter written by Dr. Glazier, who died of yellow fever last month at Key West:

KEY WEST, FLA.—The late Dr. W. C. W. Glazier, who died of yellow fever on the 12th of December, while in charge of the Marine Hospital at that place, wrote on the 7th of December as follows: "There have been no cases of dengue, reported as such, in this place, excepting that the first case of yellow fever officially reported was said to have 'degenerated from a mild form of dengue.' In my conversations with physicians who have had a considerable practice in the city I have learned nothing of the peculiar pains or eruption of that disease. * * * It is very difficult to arrive at any conclusion in regard to the sickness here this summer. The physician who treated the most cases—between 160 and 200—called the first case 'congestive fever' in the burial certificate. I believe his first cases occurred in July. After the official report of the above case of 'degenerated dengue' he remembered that all his cases were cases of yellow fever. I have received a note from another physician, who had a large number of cases—between 60 and 100—and he says that he has not seen a case of dengue. Another told me a few evenings ago that he had not seen a case of dengue, although he had treated over 60 cases of fever. I have had no cases in the city, but I have seen a few well-pronounced cases of yellow fever in the practice of other physicians. All that I saw that had albuminuria died. In none was there the pain in the limbs or the eruption. I visited Havana recently expressly to see yellow fever where there could be no doubt as to its identity. I saw cases in charity, military, and other hospitals, and they were to all appearances identical with those I saw here."

The following reports for the week ending January 8, 1881, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 5; under 5 years, 1; consumption 2, diarrhœa 1. Allegheny, Pa., 78,000; deaths, 29; under 5 years, 12; consumption 3, diphtheria 1, typhoid fever 3, pneumonia 1, bronchitis 2. Bath, Me., 8,000; deaths, 5; consumption 1, erysipelas 1, pneumonia 1. Belfast, Me., 5,308; deaths, 4; pneumonia 1, pleurisy 1. Bowling Green, Ky., 6,000; deaths, 3; accident 1. Brattleborough, Vt., 6,000; deaths, 4. Calais, Me., 6,162; deaths, 4; under 5 years, 1; consumption 1. Carrollton, Miss., 600; death, 1. Chillicothe, Ohio, 11,000; deaths, 3; under 5 years, 1; accident 1, diphtheria 1. Circleville, Ohio, 6,000; deaths, 2; consumption 1, bronchitis 1. Corinth, Miss., 2,264; death, 1; bronchitis 1. Dallas, Tex., 10,630; deaths, 3; under 5 years, 1; consumption 1, diarrhœa 1. Decatur, Miss., 1,000; death, 1; under 5 years, 1; whooping-cough 1. Fayette, Miss., 400; death, 1; under 5 years, 1. Gunn City, Mo., 125; no deaths. Helena, Mont., 3,630; no deaths. Hernando, Miss., 1,000; no deaths. Huntingdon, Tenn., 1,200; no deaths. Huntingdon, Pa., 4,500; deaths, 2. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,351; deaths, 3; under 5 years, 1; consumption 1, bronchitis 1, puerperal 1. Kenosha, Wis., 5,500; death, 1. La Salle, Ill., 8,885; deaths, 5; under 5 years, 4; scarlet fever 1, bronchitis 1, consumption 3. Lonisiana, Mo., 5,200; deaths, 2; under 5 years, 1; pneumonia 1, measles 1. Madison, Ind., 9,000; deaths, 5; under 5 years, 1; consumption 1, erysipelas 1, puerperal 1. Marquette, Mich., 5,000; no deaths. Martinsburg, W. Va., 6,384; deaths, 2; pneumonia 1. Milan, Tenn., 1,800; deaths, 3, pneumonia 1, puerperal 1. Milledgeville, Ga., 3,000; no deaths. Monmouth, Ill., 6,000; death, 1; puerperal 1. Morton, Miss., 210; no deaths. Mount Pleasant, Iowa, 4,500; death, 1; old age. Muscatine, Iowa, 8,412; deaths, 5; under 5 years, 1; scarlet fever 2. Muskegon, Mich., 11,300; death, 1; diphtheria 1. Niles, Mich., 4,200; no deaths. Painesville, Ohio, 5,504; deaths, 2; under 5 years, 1; croup 1. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; deaths, 3; under 5 years, 1; pneumonia 1. Plymouth, Mich., 3,000; death, 1; consumption 1. Port Gibson, Miss., 1,200; death, 1; under 5 years. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; no deaths. Rockland, Me., 7,500; deaths, 2; pneumonia 1. Santa Cruz, Cal., 5,000; no deaths. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 6; under 5 years, 4. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 3; under 5 years, 1; croup 2. Tuscaloosa, Ala., 2,000; deaths, 4; consumption 1, old age 2. Watertown, Wis., 10,000; deaths, 3; under 5 years, 1; pneumonia 1, old age 1. Winchester, Va., 5,000; deaths, 4; under 5 years, 1; pneumonia 1, old age 2. Winona, Minn., 10,000; deaths, 2; under 5 years, 1; congestion of lungs 1. Youngstown, Ohio, 15,089; deaths, 6; under 5 years, 1; consumption 1, congestion of lungs 1. Total population, 342,113; deaths under 5 years, 53; total number of deaths, 133; annual rate per 1,000, 20.2.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

Countries	Places.	Population.	Week ending—	Total deaths.	Annual rate per 1,000.	Cholera.		Yellow fever.		Small-pox.		Typhoid fever.		Typhus fever.		Other contagious diseases.		Weekly mean of thermometer.
